since you poted in this group, I'm assuming you want to use this equipment for data. If that is the case, I suggest you take a look at www.arrl.org, it has a lot of books that can thoroughly answer your questions. If you don't want such detailed info or you don't want to buy a book, try finding some ham's personal websites. We just love to ramble about our equipment! If you want to get more info than a book could supply (and more than you will ever want), just send an email to one of the hams you find on the web. Remember, specific questions get specific answers.

2873. Texas Lids Destroy TexNet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-26 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6n0u2k$lfa@enews2.newsguy.com>
Source record: 23455

TPRS, (Texas Packet Radio Society) has recently come out of the closet as a Non-Ham organization. According to the TexNet network manager, N0CCW, only the name has anything to do with Amateur Packet Radio. TPRS is not, in fact, an Amateur Radio organization no matter what it's name may imply.

It's ironic but true that if you want to support Amateur Packet Radio in Texas, The "Texas Packet Radio Society" is the very last place you should consider sending your money. They are not interested in building an Amateur Packet Radio network at all.

Take a look at the May '98 issue of TPRS's "Q-Report" to see what I mean.. No mention of packet radio, except how it's somehow just not good enough.. The bulk of the newsletter is dedicated to the "great challenge" of abandoning Amateur Radio so that all of TexNet's nodes can be linked to each other by the Internet instead. - Along with an implication that in the near future, TexNet nodes without good *Internet* connections will be phased out of the network altogether. I know that many of the TexNet node-ops are real Hams, and these appear to be the ones TPRS intends to edge out.

What kind of an organization would deliberately plan on edging out Hams using
Radios in favor of "digital communications hobbyists" using The Internet, or "wirelines" donated for the purpose by commercial communications outfits? Why TPRS, of course. - The worst enemy of Amateur Packet Radio in Texas, and the best friend of the commercial communications outfits who would love to grab up our spectrum.

When irresponsible "digital communications hobbyists" go out of their way to undercut our use of Radio by Hams, imposing instead an unseemly dependence upon Non-Ham means of communication, they leave all Hams wide open to attack by commercial communications outfits who covet our bit of spectrum. " Why do they need (Insert Band here) if they prefer to use the Internet anyway? " -- A very good question!

Why, I wonder, is the "Texas Packet Radio Society" so cozy with commercial communications outfits, constantly pushing Non-Ham means of communication while distancing themselves further and even further from Amateur Radio and their fellow Hams?

That's not the kind of people I would care to be associated with. I'd rather work with Hams. - Real Hams who want to see Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled TPRS since it started are of a mighty high opinion of themselves.. They appear to believe that if THEY cannot figure out how to surmount a problem,

then of course nobody else ever will or could either, and that the best policy for all Hams is to "be realistic" and give up on Amateur Radio right now, in an organized fashion.

In fact, most of the innovation and industry recently associated with the Texas Packet Radio Society appears to have been in that very direction; Leading Hams to abandon Amateur Packet Radio networking in favor of Non-Ham means of communication.
N0CCW was giving us the straight scoop when he said that TPRS is not an Amateur Packet Radio organization. It appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio soon, so that TexNet will no longer be an Amateur Packet Radio network at all. -- And they look forward to that as "progress" ?? ! ??

I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Hams, whether they live in Texas or not.

When "Digital Communications Hobbyists" (Packet Hackers) route Amateur Packet Radio network traffic over the Internet, they directly undercut the essential reason for allowing Amateur Radio operators the stewardship of our bit of spectrum in the first place.
They cut the throats of all of their fellow hams in the eyes of Congress.

Additionally, simulated "packet radio networking" using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts. - It edges out the Hams.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which Hams are being edged out of the packet net in the U.S., and is doing what he can to accelerate the process.
What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate.

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to destroy
Amateur Packet Radio networking in Texas, and replace it with an utter dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend

that simple distinction, and who show no respect for Amateur Radio and their fellow hams.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it
would be a waste of my time (not to mention the slur on my character)
if I were to participate in the activities of TPRS.

If "digital communications hobbyists" are starting to take over YOUR Amateur Packet Radio organization, take a hint from the state of Texas, and weed them out right now. You'll be glad you did, and you'll be sorry if you don't.

Thanks for taking the time to look and think this over.

2874. Help with PK-88

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-26 00:00:00 UTC
From: Radio Randy <rjones@plix.com>
Message-ID: <35945596.3381@plix.com>
Source record: 23456

Hi all,

Has anyone else experienced this problem...the DCD light on my PK-88 stays on when the unit warms up. Of course, it's then useless as a mailbox, HI.

I suspect an IC (probably one under the big heat sink) but would like to know of any common part failure so I might save some troubleshooting. Besides, when I remove the cover, the unit cools down and makes it tougher to find. Thanks.

Radio Randy

Aw, hell, just buy FRS radios and use THEM, everyone else does! Then you won't p__s off the hams OR your local McDonalds, just some locals trying to keep track of their kids (how long will it be before some pedophile gets the idea to lure kids via FRS radios?).

2876. FS: TNC MFJ-1274 TNC2

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-26 00:00:00 UTC
From: "Donald Harter Jr." <dhart@grfn.org>
Message-ID: <Pine.GSO.3.95.980626170047.8744A-100000@freenet.grfn.org>
Source record: 23458

I have a MFJ-1274 TNC 2 for sale.
It has the row of leds/ tuning indicator.
The microprocessor was upgraded to Z0840006 PSC Z80 CPU.
Also Z80 SIO/0 Z0844006 PSC was upgraded.
The EEPROMs read TNC-2 1.2.9 systek state and 1.09
I have 2 manuals for it.
The TNC worked fine when I last used it.
Some TNC-2s had a design defect in their hardware handshaking.
This is easily fixed by jumpering pins 4 and 5 (?) on the serial
connector.
I don't know if my TNC has this defect. When transfering large files
I has some problems(buffer overun?) but that may have been a dos/other
node problem.
I was going to perform the mod, but I never got around to it.
I have 2 custom cables that I made up that are included. I don't remember
which 2 meter rigs they are for. Supposedly there are some web sites that
have
cable information for different rigs.

Make me an offer on this TNC. Shipping will probably be by priority mail
or UPS.

Donald Harter Jr.

Direct from the pk-232 manual

KIss "n"
Mode:packet
Default: 0

Parameters:
"n" is a HEX number from $00 (KISS disabled) through) $FF that enables the KISS mode selected from the table below.

The KISS mode must be entered to prepare the PK-232 for KISS operation, TCP/IP and other special applications have been written that require the KISS mode to be enabled to operate correctly. For normal AX.25 Packet operation, this command should be left at 0 or OFF (default).

The KISS command, formerly ON/OFF, has now been expanded to a numerical value from $00 - $FF. This expansion supports G8BPQ's multi-drop KISS protocol. The table below describes available KISS options.

KISS $00: KISS disabled (formerly displayed as KISS OFF)
KISS $01: Standard KISS (same as KISS ON or KISS YES)
KISS $03: Extended KISS
KISS $07: Extended KISS + KISS polling enabled
KISS $0B: Extended KISS + KISS checksum enabled
KISS $0F: Extended KISS + KISS polling and checksum enabled

Note that KISS ON enables standard KISS operation for compatibility with existing applications.

Extended KISS mode adds these commands to the standard commands ($x0-$x5):

$xC signifies data to be transmitted. Unlike the $x0 command, the $xC byte is followed by two frame ID bytes, then the data; when the TNC transmits the frame, it notifies the host application by echoing back FEND, the $xC byte, the two frame ID bytes, and FEND.

$xE is a polling command, similar to HOST "GG" command existing in AEA products. Polling makes multi-TNC KISS operation possible. If KISS polling is enabled, the TNC holds received data until the host application sends the poll command. If the TNC is holding no data, it echoes back FEND $xE FEND. The "x" in "$xE" must match the number in the KISSADDR command for

the TNC to respond.

If KISS checksum is enabled, a checksum byte is added to the end (before the final FEND) of all KISS blocks flowing between the TNC and the host application. The checksum is the exclusive-OR of all other bytes between the FEND bytes, taken before KISS escape transpositions. A checksum is helpful when using multiple TNCs on a marginal RS-232 link. If the PK-232 receives a KISS block with a bad checksum, it does not transmit the data.

In KISS and Raw HDLC modes, communication activity of the rs-232 link is shown by illuminating the STA and CON LEDs as follows:

Host to TNC communication: STA LED Illuminated.
TNC to host communication: CON LED Illuminated.

HOST OFF (3 <ctrl-c)s) will force KISS OFF. Details on the use of KISS TNC protocol are contained in AEA's Technical Manual for the PK-232

Hope this info helps you.

Your best bet is to run G8BPQ node software so that you can use the PK-232's extended KISS mode, with polling and checksum.

Then, run JNOS off of 'BPQ.

Extended KISS is much more reliable than standard KISS mode. - It's worth the extra trouble.

Standard KISS mode is pretty worthless. It works, but it's generally not reliable, and sometimes messes up in way which are hard to detect but nonetheless can still cause major headaches. Standard KISS TNC's sometimes lock up or go out of KISS mode for no particular reason. - Who needs it?

In Germany, the authors of FlexNet have purposely avoided making a standard KISS driver for FlexNet, siting the unreliability and slowness of KISS. It's just not good enough for serious use with Amateur Packet Radio. (The same is true of JNOS, but that's another story.)

Hope this helps!

Yeah.

BTW, wasn't there also the Electrolytic connected round the wrong
way, or was that the TNC 200 / 220 ??

copied from packet:
Msg# TSP Size Read To @ BBS From Date/Time
25853 BN 1240 0 ALL N2EZG 8903/1617
Subject: Paccomm Tiny-2 Factory Mod

Here is the "Factory" fix for Pac-Comm Tiny-2's & Micro-Power 2's
that have become hard of hearing. It seems that Pac-Comm has some
boards out that work fine when new, but with age the tnc requires
a huge amount of Audio input from the speaker jack or it won't
decode properly. They are lost as to what is deterioating in the
boards but offer this fix to its customers.
It is quite simple and very neat, all parts are mounted on the
under-
side of a 16 pin IC socket, the Modem chip TCM3105 (U16) is
removed,
the modified socket is inserted into existing socket on TNC's
board,
and the modem chip is re-installed.

Parts Needed:
1 - 16 pin IC socket
1 - 2222 Transistor NPN (EGC 123AP)
2 - 10000 ohm 5% resistors (brown-black-orange-gold)

Instructions:
Solder 1 resistor to Emitter, other end of resistor to pin 12
Solder 1 resistor to Base, other end to pin 2
Solder collector to pin 5
>EndFile<

Cheers,

G.

This supports my "Garbage in, Garbage out" theory. David couldn't talk enough trash about Field Day here.. He probably did it around the hams in his area too... So who would want to QSO with him? I certainly do not blame anyone for simply ignoring him.

You get out of it what you put into it... "Garbage in, Garbage out" in David's case.

I've got you beat, David. I had a whole 3 users check into my BBS,
which was about the only packet activity (other than forwarding and
POPmail users) I've seen on the LAN all weekend.

Of course, connecting to a BBS isn't exactly a Field Day activity,
but in years past (waaaay past), I can remember lots of people
doing live packet during the contest.

As for myself, I made ZERO FD contacts, but I did manage to
finish putting up a pool this weekend!

[snip]

I've seen this quoted before, and it amazes me. The Tiny-2, like many
other TNCs, uses the TCM3105, which has more than adequate sensitivity.
There are a couple of resistors and a capacitor between the audio input
to the TNC and the 3105 - not too complicated! Did Paccomm really say
that they couldn't sort out the cause of the problem? I would have
thought that anyone with a scope and five minutes to spare could manage
it!

2910. Need Source for Tape or Digital Record-Playback Loop for Railroad Museum

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-29 00:00:00 UTC
From: Livermore Elementary School <livermore@kih.net>
Message-ID: <6n84oc$m8q$1@dbtsvr2.dbtech.net>
Source record: 23394

The City of Livermore, Kentucky is preparing a small historical museum honoring railroad freight and passenger service which once was important to Livermore's livelihood. In the past, much of Livermore's population was engaged in coal mining and in the manufacture of wooden furniture.. Though the railroad is no longer present, a railroad caboose has been procured and is being refurbished as the museum. The caboose has been placed where once the railroad terminal of Livermore stood and is surrounded by a small park and a exercise track.

Now to my point, three elderly people who once depended on the railroad passenger service from Island, Kentucky to Livermore want to tell of their experiences. The total time required is about 15 minutes. They would like to record these accounts on tape or by some digital device which would play the historical account each time a museum visitor pressed a button. There would be no charge to play the account, so there is no need for money slots or change makers. If you have a source for such a devise please let me know.

Thanks for your time and any assistance you provide.
.

I just complained about the fact that the ARRL cut packet off at the
knees this year. I didn't say to boycott it. As a matter of fact, I said
here that I'd be on the air on Field Day, as I was. If they don't want
the packet points, then they are not obligated to get them, and since no
one put forth the effort but our club station (it seems), then thats
points they didn't get.

You are grasping for straws, Mr. Brabham. I was in contact with, via
packet radio, and aquired an amprnet IP several months ago, from my
coordinator. He said there isn't much going on with TCPIP in my area.

Let me also add, even with ATCPIP, you can monitor the senders and
receivers of such traffic. Charles, you are grasping for straws.... the
ARRL killed packet this year, and there not much you can argue about it.

Basically, W1AW packet bulletin was copied from HF, so we didn't need to find that (but did anyway). Most of what happened on packet was that we sent packet-mail to a club member out at a woods camp for the summer, and checked our mail several times.

The only exciting thing in packet, is evidently the thermodynamic stresses of summers and the lack of good heat drain on the MFJ1270B of mine, took a casualty, the voltage regulator...

Since high speed packet isn't extremely common yet, finding equipment and information can be somewhat time consuming and expensive. But don't let that stop you... As soon as more people like you start to use it, it'll catch on.

>
>I want to work w/ 56k and up...

Hmmm... that's a pretty good clip... 1.2K is the most common with 9.6K now fairly common also. 56K is pretty rare, however, it appears Paccomm sells some equipment designed for that speed. Check out http://www.paccomm.com

You might also want to do some research in spread spectrum radio, it's not to common in amateur radio (yet), but it seems to be very popular in the commercial world. It's definately something worth checking out.

2920. Packet Radio Questions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-29 00:00:00 UTC
From: Tobin Fricke <fricke@mae.engr.ucdavis.edu>
Message-ID: <6n9mvl$8vg$1@news01.deltanet.com>
Source record: 23404
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

Hello. I'm interested in getting into packet radio, but, as a clueless newbie, I have some (alright, many) questions. I'd like to be able to run Linux and do cool radio networking stuff. I'm familiar with Linux, but I'm not quite so sure about how the radio networking works. I'd also like to be able to do simple text messaging such that the messages get routed "home" somehow.

I've been looking for a FAQ, but I haven't found a good one yet. Where should I look?

There's AX.25 and there's TCP/IP. Are they mutually exclusive? What are the ''features'' of each?

ROSE? KA9Q? What are all of these?

How does the radio network ''feel''? I get the impression that a TNC by itself forms a kind of store-and-forward network, somewhat like fidonet. What about with TCP/IP or AX.25? Can you telnet transcontinentally?

With a 2 meter HT, a TNC, and a laptop running Linux, can I stick an antenna up in the desert and be able to send email to the Outside World?

Back at home, with a TNC, radio, and a machine with a T-1 connection to the internet, would it be possible to set up an internet gateway of my own?

If there isn't an internet gateway in the area where I am, can "messages" be forwarded to one by other stations? Using TCP/IP? AX.25? store-and-forward?

Are there satellites carrying packet radio? How difficult is it and what is necessary to access them?

What should I look for in a TNC, and in a radio, if I want to do this? What should I be careful of?

Thank you,

The fix does date from 1989 or before. A lot of 'age' problems can usually
be traced to electrolytics 'drying out. A friend has borrowed my old
tiny-2 so I can't have a poke around and see if there's any near the heatsink.

The PTC-II is the only one that does Pactor-II. The one I have works great. I've never used the DSP2232. It and the PTC-II are DSP boxes. The MFJ is an analog unit. The DSP-232 has problems and I don't believe it's currently supported by anyone. In my opinion, if you're working primarily HF and have the $$$ go for the PTC-II.

The reason this all happened was that in the 50's, an investigation of an air crash concluded that the pilots VOR was inoperative or gave false readings . Apparently in the wreckage they found a portable FM broadcast receiver with the switch in the on position. Further investigation showed that the local oscillator frequency (10.7MHz above the broadcast frequency) was radiating on the plane's VOR frequency. Since that happened the FAA prohibited operation of all radiating devices (including receivers) aboard commercial aircraft.
The best advice is to turn everything off when boarding a commercial aircrafe and leave it off until the plane is back on the ground.
As far as I know there are no prohibitions from operating ham radio from private aircraft and many of my friends do it.

2924. VOLKSRTTY Help - I think I blew it

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-30 00:00:00 UTC
From: Joe <jchutch@ne.mediaone.net>
Message-ID: <6ncb17eni1@ndnws01.ne.highway1.com>
Source record: 23334

I built the VolksRTTY modem from April QST, was just getting it running and was starting to test out/review HamCom, when I inadvertently connected the receive line to the transmit line on the transceiver. (yea, I know -- stupid!).

Now, as soon as I plug the computer side of the modem into the com port, the PTT immediately switches on.

The modem still seems to be able to receive in RTTY, but as soon as I plug in the transmit line, if the serial port is connected, I am off and transmitting whether I want to be or not.

I figure I blew the switching transitor(s) in the modem. I hope I did not blow something in the com port. The port still works with a mouse, but I don't know if the mouse uses the same lines in the serial port (RTS?).

Anyhow, I am going to pick up a transitor or two and see if that fixes the problem. If anyone has any thoughts on this (other than the obvious comment on how could I have mixed the cables up this way -- hi), please drop me a line.

Thanks.

Joe

And, BTW, what about the CAP people, who RX/TX on FM quite a bit, and
send SSTV and use APRS while flying? There is no ban on the use of FM
transceivers on General (non-instrument) aviation.

Furthermore, most (if not all) Commercial Passenger Jets designed for
overseas service have SHORTWAVE transceivers on them. Many can be
tuned into the ham bands and used legally. A local ham I know talks
to his pilot brother (who is also a Ham) while he makes his flights
from Phoenix/LA to Hawaii (which is his normal run).

the info is readily available on the web, or via http:\\www.dejanews.com there is a search engine there that will let you look for the keywords "ft-50", and "mod".

Warning: most of the mods you will find are out of date and will only fry your radio. Yaesu has been agressive about fixing the out of band transmit abilities of the ft-50. Doesn't mean it can't be done, just be careful.

I doubt seriously that the ARRL was there at your locale to discourage
packet ops from making contacts. Were you by any chance the packet op at
your FD event? Do local packet ops know that you are a LandLine Lid?

I could be that you were simply avoided. I know I wouldn't bother to QSO with you. I like anything I do on FD to be Ham-related.

Maybe that's what the ARRL was thinking, too. A good deal of the former "Packet Radio network" is now comprised of Non-Ham links. - and so would not be valid for FD activities.

Thanks a lot, LandLine Lids!

I've been working on one, it can be found at
http://www.csl.mtu.edu/~jpbialas/
It's incomplete and has quite a few gaping holes in the info, but it might
help you get startes.

>
>There's AX.25 and there's TCP/IP. Are they mutually exclusive? What are the
>''features'' of each?
>

AX.25 is a very simple protocol allowing you to "set up shop" anywhere and
start operating. It provides a very simple protocol for connections and
transfer of text. Nearly all TNCs already have the software built in for
this. TCP/IP is a significantly more advanced protocol useful for setting
up more permanent networks. It requires obtaining an IP address from your
local TCP/IP coordinator. TCP/IP allows for significantly more complex
networks than AX.25 allows. And no... they are not mutually exclusive.
Most TCP/IP software will allow you to use AX.25 and allow people to
connect to you using AX.25.

>ROSE? KA9Q? What are all of these?

ROSE is a seperate protocol, which I currently don't have much information
on. KA9Q is a simple MS-DOS implementation of TCP/IP- it's also been
ported to several other OSs (I have it on my atari and amiga).

>
>How does the radio network ''feel''? I get the impression that a TNC by
>itself forms a kind of store-and-forward network, somewhat like fidonet.
>What about with TCP/IP or AX.25? Can you telnet transcontinentally?

This is AX.25 specific:
Well, some TNC's have built in BBS software that allows for people to
leave simple messages, some TNCs have advanced "reverse fowarding" that

allows you to transfer messages back and forth with a local packet BBS.

As far as continent spanning connections, they're pretty rare. By connecting to someone elses TNC and connecting to another TNC from that TNC, you can effectivley hop quite aways, large BBSs will sometimes have permanent routes setup to save the time of finding your own. I've made it about 750 miles doing this, however, bouncing through several nodes makes things SLOW.

As far as TCP/IP, the routing capabilities of that protocol allow for some greater felxibility in large networks, howver a cross-country telnet will probably find your packets travelling over the internet part of the way.

>
>With a 2 meter HT, a TNC, and a laptop running Linux, can I stick an antenna
>up in the desert and be able to send email to the Outside World?

Technically: Yes.
Realisticly: Maybe- there will have to be a packet BBS nearby to connect to that allows for sending messages world-wide. Satellites are also a possibility (see http://www.amsat.org)

>
>Back at home, with a TNC, radio, and a machine with a T-1 connection to the
>internet, would it be possible to set up an internet gateway of my own?

Yup, it's real easy using Linux. The club at my college did a great job setting one up using TNOS- see http://w8yy.resnet.mtu.edu

>If there isn't an internet gateway in the area where I am, can "messages" be
>forwarded to one by other stations? Using TCP/IP? AX.25? store-and-forward?

Yes... either protocol will work.

>Are there satellites carrying packet radio? How difficult is it and what is
>necessary to access them?

Yup.... Never used 'em myself. The equipment you need is pretty specialized. Although, Mir used to have a simple setup that only required a TNC and 2M FM radio.

>
>What should I look for in a TNC, and in a radio, if I want to do this? What
>should I be careful of?
>

Well, to get the most use out of your equipment, find out what people in your local area are using. I'm partial to KPC-3's and 2M radios, but if everyone in your community are using 9600 baud equipment on 70cm, that KPC-3 won't be much help.

> in the US?

My point of contention is not that I was the only one in the US on HF
packet, but in our area, the only ones with VHF packet, I know at least
one club in this area had no packet setup at all, because as I was told
last night, it just wasn't worth the effort this year. Trying to pry HF
rigs out of the hands of CW and Voice operators for packet is like
pulling teeth, especially after the ARRL reduced it to next to nothing
this year.

> >Let me also add, even with ATCPIP, you can monitor the senders and

They know I am "in to packet". They also know I use radios. Am I suppose
to care anyway (Its not that I don't care about the HAMS, but why should
I care about what they think I should be experimenting with? Seems to me
it would be a waste of individuality that has made HAM radio so big in
the past. If internal politics dictated the direction of amateur radio,
the hobby wouldn't exist anymore.)? Should they not route my packet mail
because I might possibly someday use the internet in combination with
packet? I should think not.... censoring me for anything other than
raunchy language would be true lid behaviour. It would also be an
encouragement, for me, not to work with the established community at
all. What would that do for your little personal war, Brabham? You know,
if I just disregarded what was out there already, so utterly and

completely and trully embraced a hybrid internet/packet network,
wouldn't that pretty much make your arguement completely useless for the
subset of people using my network? Though, its not totally clear to me
where you fit into packet anyhow, except to atogonize the entire
community into some sort of internal war.

>
> I could be that you were simply avoided. I know I wouldn't bother to QSO
> with you. I like anything I do on FD to be Ham-related.

Doubt it, as I said, I have talked to a member of one major club in the
area. They said the ARRL made packet pointless. Your reaction to that?
Please keep in mind, that to my knowledge, that club has never
considered an internet link, or wormhole. Just blows away all your
assumptions, doesn't it? Where does your LLL paradigm place this group
of radio operators?

>
> Maybe that's what the ARRL was thinking, too. A good deal of the former
> "Packet Radio network" is now comprised of Non-Ham links. - and so would
> not be valid for FD activities.

Yeah, Charles, the TheNet switch in our area is linked directly to the
internet, NOT! All we needed is one or two digipeaters or switches to
make contacts, but we couldn't even use that. Once again, a situation
where the LLL theory just can't cover the ground it was intended too.
Remember, its much easier to disprove a theory for one case than it is
to prove it for all cases. Brabham, the LLL arguement is broken, from
its conception to its fruition in your posts. Drop it. Don't use a
broken tool to do a job. Youu could injure yourself and others, as is
the case with the LLL paradigm.

David

2935. Re: Field Day and Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-06-30 00:00:00 UTC
From: Pearce <dlpearce@eos.ncsu.edu>
Message-ID: <3598FB59.7A46@eos.ncsu.edu>
Source record: 23415

Addendum: May I make it clear, even though packet was dead this year as a points getter, packet still held a lot of interest to both members and guests of our club setup. All this attention to packet, despite Brabham's contention that I am a LLL. I hope that this post is not taken as a cheap attempt by me at popularity, but as one more demonstration of how the LLL paradigm as instituted by Brabham, is a completely invalid body of assumptions made to slander those who choose to work with ATCPIP and experiment in their own ways, within FCC regulations, on amateur packet radio.

My setup on field day included:

Cyrix 6x86MX System with Windows 98,95, and Linux
High mounted ground plane antenna (we could tag every
BBS/switch/digipeater in the Raleigh area)
HTX202, later a Alinco D1200 (when my MFJ bit the dust in the heat)
MFJ1270B, later a PK88
Opti-Ups 650ES

It may be a bit ironic, but when the generator ran out of gas, the entire packet station was fully operational and could have operated for 15 minutes at its level of power consumption from the UPS. No other stations were operational.....which brings the arguement again to why packet was undercut by the ARRL this year...

David

Find the "AX25-HOWTO" document at sunsite.unc.edu -- it should be under
/pub/linux/LDP or something like that ("LDP" is Linux Documentation Project,
the home of almost all the FAQ and HOWTO documents). The HOWTO provides
pretty good information on configuring Linux for AX.25, including NetROM,
ROSE, and TCP/IP.

There's also some information available at my web site
(www.febo.com/packetnet), including some sample configuration files (which are
unfortunately a bit out of date right now; I hope to update them soon).

Linux is a very capable platform for ham radio. We're using one Linux box to
provide AX.25, NetROM, and TCP/IP routing, as well as being an APRS digi and
gateway system. Another Linux box runs our local PBBS system. The machines
stay up for weeks and months at a time -- hardware failures are about the only
things that bring them down.

For Field Day, I powered my Thinkpad 760EL using the Cigarette Lighter Adapter connected to our Solar Panel/Battery Array. It worked quite well, except for the three hour period when someone disconnected it and we were running on the Lithium Ion Internal Battery. Fortunately, I had brought a backup NiMh for it, since the Lithium Ion needed more voltage to charge.

Good luck!

i have recently bought a PacComm Tiny-2 TNC for 1200 baud packet use. I am able to use it under winPack V6.4. However, i was wondering if it was possible to use AGW with it as i find this program much nicer to use. I have having problems settign the commands for kiss on, restart and then to take it oout of kiss mode when AGW packet engine is exited. Any help greatly appreciated. Also, please send the email to iceman778@hotmail.com as i cannot check the above email address often.

thanks!

.....which brings the arguement again to why
>packet was undercut by the ARRL this year...

Packet was not undercut. You could make contacts on packet.

As I said earlier, the use of ANY pre-existing infrastructure defeats the purpose of Field Day. Are you saying that packet is not usefull without preexisting infrastructure? I don't think so. It (digital modes) should be the cornerstone of any emergency operation plan. But for Field Day, all of the infrastructure needs to be established during the Field Day setup period (or as someone said earlier, "an instant up network). That's the change I'd like to see get made to the contest rules.

Where did you get that info from. Seems someone is trying to pull the wool
over your eyes. If you are the owner, the pilot of the aircraft or get
permission and have a valid amateur licence then you can run on the ham bands.

The way I viewed packet this year, after speaking with other clubs, is that most clubs have only considered packet to be a 100 point bonus, not as useful communications medium for emergency preparedness. This means I will have to switch my arguement away from the digipeating arguement, which I am happy to do since the evidence doesn't support it. Which means, when the ARRL chucked the packet mode into the "new digital mode", most of these contestors no longer consider it worth the time or effort. I could have contacted anyone within Raleigh directly, had they had a station running....

Could someone comment on how good these multimode TNCs are? especially
in comparison to each other?
I have heard frustrating reports about the DSP-232. Does it mostly work
(ie the modes work, but there are
one or two modes that do not, would it work as a normal packet vhf/hf
tnc?) It also seems like the only
competition that the DSP-2232zx has is the PTC-II.

Here are the rules on radio in aircraft.
John'
KC4ZXX

97.11 Stations aboard ships or aircraft. - (a) The installation
and operation of an amateur station on a ship or aircraft must be approved
by the master of the ship or pilot in command of the aircraft.

(b) The station must be separate from and independent of all
other radio apparatus installed on the ship or aircraft, except a common
antenna may be shared with a voluntary ship radio installation. The
station's transmissions must not cause interference to any other apparatus
installed on the ship or aircraft.

(c) The station must not constitute a hazard to the safety
of life or property. For a station aboard an aircraft, the apparatus
shall not be operated while the aircraft is operating under Instrument
Flight Rules, as defined by the FAA, unless the station has been found to
comply with all applicable FAA Rules.

Oh horse puckey. The PIC (Pilot In Command) can transmit on any band he/she holds a license for. As can anyone on board the PIC has approved to do so (subject to *their* licensing). I've worked 2M FM legally several times from my Cessna 152. There are *many* pilot/Hams who do so. The Federal Aviation Regulations (FARs) do prohibit use of electronic gear, including transmittors, in flight *unless approved by the PIC or carrier*.

As far as "only aircraft frequencies" are concerned - how do you think all the radio/TV airborne traffic reports come in? Not between 118 and 135 MHz...

Courtesy counts as always - it's easy to hit several repeaters at the same time from aircraft altitudes or to otherwise monopolize a frequency over an enormous area. And the Amateur Radio Service certainly has a history of knowing how to deal with that.

Enjoy your hamming -

Jim Horn WB9SYN/6 PASEL 2198091 Air Mobile - two good hobbies at once!

I wonder if that idea came from some other (out of context) postings?

It *is* illegal to transmit from a *commercial* aircraft. (it used to
be OK if you had the captain's permission though several airlines had
a blanket policy against their captains giving permission. Seems to
me someone told me the regulation was changed a few years back to a
blanket prohibition on transmissions from commercial planes.)

It *is* illegal to use a cellular phone in an aircraft, even a private
plane. This not really for air safety reasons, but because it
"breaks" the assumption that a specific phone will see a limited
number of cells; if more than a very small number of people began
using cell phones from aircraft, they could run short of channels.

It is *not* illegal to transmit in the ham bands from a private
aircraft. (of course, provided you have a ham license!) I, too, have
worked more than one aeronautical mobile on 2 meters simplex.

In Canada, you can operate aeronautical amateur mobile station if you
have a permission from pilot in command (i.e. you are a pilot and
flying the airplane) unless otherwise specified.

If he is saying that he is wrong. There is no problem with air mobile
operations. The FARs preclude the use of transmitters on commercial
aircraft but in a private aircraft it is up to the PIC. In Alaska you
hear air mobile all the time even on HF.

Hi folks,

I am interested in finding a software program that works with a
Window's computer's sound card to decode and display CW.

I have looked in several places and have found tons of SSTV, RTTY
FAX decoders but no CW decoder programs.

Is there some technical reason for this or just lack of demand?

Thanks.

I know an airline pilot who says the HF equipment onboard works just fine on the ham bands.

He didn't say whether he was SUPPOSED to be using the equipment for that - only that he does.

Then why do they allow personal computers operating during flight. We hams
know that a lot of rf radiates from those devices. Seems they would also
restrict the use of those during flight. They only ask you to turn off the
devices during takeoff and landing.

2957. Idea for New, Faster & Better AMPRNet & Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-01 00:00:00 UTC
From: Matt Green <matt.green@shef.ac.uk>
Message-ID: <01bda508$07bd2680$LocalHost@mattg.shef.ac.uk>
Source record: 23341
Cross-posted to: alabama.birmingham.radio.amateur,aus.radio.amateur.digital,es.rec.radio.amateur,nl.radio.amateur,rec.radio.amateur.digital.misc,uk.radio.amateur

Hi everyone,

I just thought I'd run this idea by people:

Use the 2.4 GHz (14cm) band with IEEE 802.11 compliant Spread Spectrum radio modems to provide local area connectivity (upto 10km). The chipsets are available to assist in this already.

Have a locally elected router node, supporting IP routing and using the Radio Shortest Path First (RSPF) algorithm to automatically manage the network.

The routers could interoperate using 802.11 on 2.4/3.4/5.6 GHz, the advantage of the higher bands is that if local access traffic is kept to 2.4GHz, then router-router performance is much better (using single channels in the 2.4GHz band would suffice).

More services and possibilities, provide a full emergency situation comms system including audio & video over wide areas......

Simple eh? Anyone interested? Reply here.....

Matt Green G7PFI

Good idea, but I don't think it has what it takes to make a large scale network. Escpecially a network that has mass appeal in the ham community. First, the equipment isn't easy to get and most of it will be home-brew or kit form (You'll lose quite a few people there). I don't follow microwave stuff closely, but from what I've seen- it isn't what I'd call "cheap".

Also, I don't really see this as very effective emergency communications. 1200 baud packet will still be the best for that... Sure, you may not be getting live video, but my trusty 2M equipment is way more dependable that any of the commercial microwave stuff I've used.

At my last job, I messed around with some microwave networking equipment designed to be used inside a building. There is quite a bit of commercial equipment out there, if this stuff can be converted to be used in amateur bands, you'd probably have more luck getting people interested. Hey, we could finally answer the PCMCIA TNC wish, one of the things I used was a transceiver and network card all built into a PCMCIA card.

Microwave does hold some potential for setting up backbones in somewhat populated areas. But microwave user ports are probably aways off. And microwave will never work for backbones around my home. Heck, even 70cm is a bit too weak.

It sounds like a great setup, Matt, but you'd have to find an area with a dense population of rich hams to pull it off in a meaningful fashion. - And convince them all to be interested in it at the same time, and then convince them to cooperate.

In general, one thing I think we can forget as AMPR networkers is the "horsepower approach"... It worked great on my Harley, but that was only because speed parts for hogs are fairly cheap and easy to obtain. (Compared to microwave setups, SS, ect.)

What we need to be looking at instead are other ways to speed things up which are easy, inexpensive, and relatively simple to set up and operate. Also, we need to start looking beyond the conventional, standard stuff and develop something specifically tailored to RF networking. The closest thing we have to that now is FlexNet, the networking system from Germany. For point-to-point RF networking, that or the Swiss XNet are decades ahead of everything else currently available to Hams.

Look beyond point-to-point, and it then becomes possible to take advantage of one of Radio's most unique and useful features... The ability to broadcast the same data simultaneously to a multitude of receiving stations. Even if you "multicast" at a slow rate such as 300 or 1200 baud, you still will distribute that data faster over large geographical areas than any point-to-point network could ever hope to achieve, at any cost. - And Multicast is dirt cheap.

On point-to-point networks, throughput goes down as the number of stations on a particular frequency goes up. With Multicast, the opposite is true. The more receiving stations on freq, the more efficient the system. The more the merrier, and nobody has to struggle to "find a spot".

The NWS does it with EMWIN. It works - but only for info which needs to go "everywhere". Multicast will not replace point-to-point networking for this

reason. It does something which point-to-point does not do well, and visa versa. They compliment each other instead, adding up to something much more effective than the present (point-to-point only) system.

There are a number of fairly inexpensive innovations which we have not even tried yet, such as full-time network data compression, more extensive use of full-duplex backbone links, DAMA access (Comes with FlexNet), innovations related to DSP, ect. None of this stuff is too expensive or beyond most ham's technical ability. In fact, really sophisticated software such as FlexNet is actually much simpler to set up and operate than the old, slow stuff.

Well, it looks like I didn't blow the circuit after all, I just still had some of my other jumper cables crossed up, which was creating an inadvertent short in the PTT line. I was using a 2 conductor jack in a 3 conductor plug, which shorted the PTT line (using right channel in the plug) to ground. I feel pretty dumb, but a lot happier than I was last night. :)

My error what I should have said is the FARs preclude the use of
transmitters on commercial aircraft without the permission of the
Captain and owner/operator. All sorts of transmitters are used all the
time it is the unknown tranmitter in the passenger compartment that is
prohibited. As an aside I have heard hams operating from commercial
(Airline) aircraft.

I have to agree with Charles in terms of methodology. It has been documented on the net in several experiments that a polling setup is superior to a totally democratic CDMA. I would assume that FlexNet has its own way of going about it (that being DAMA).

Off course there's "horse for courses", I understand that 2m is great, everything has a plus side and a negative side too!

What I propose does have a number of plus sides, as a backbone technology, where a backbone can be deployed, it would be very useful and robust, as you say, in your location, even 70cms is not worth the effort.

Maybe there could be ports into the network backbone that have analogue technology (2m repeaters for example) that gets digitised to give the average ham on the street with a 2m handheld access to a massive wide area comms system? Any regional 2m nets or even HF (?!) could be carried across the backbone.

I would beg to differ, I'd rather use my 1800MHz GSM phone in an emergency! But of course, that depends on the surrounding infrastructure, here in the

UK, we have 96% population coverage, I guess in the States its different...

There is no reason why 802.11 cannot be as reliable as 1200bd AX25. In fact, I wouldn't want to show off but the technical facts state quite clearly that 802.11 Spread Spectrum coding is much more efficient and reliable.

I think this here is the key to success of any new high-speed network
access: Remember to allow access to regular 1200 baud ax.25 users. This
will ensure that your network will see some use and it will also give
people a chance to try the network and upgrade their equipment if they
find it useful.

The problem isn't so much the technology, I'm sure 802.11 is plenty
relaiable. It's just that the 2M frequency is pretty flexible, it works
great on short distances and works equally well over somewhat long
distances and still provides a "reasonable" amount of speed. (as far as
text messages are concerned) Microwave isn't so good on long distances and
requires line of sight. In an emergency, or just in every day use,
setting up the nodes so they can see eachother is gonna take some work.

>Thats the stuff I'm on about! Was it fun? What results did you get?

Yep, it was pretty cool, most of what I was using was designed for a
wireless LAN inside a building. It was pretty fast stuff too. Hopefully
they'll have the network implemented when I return in the fall and I can
see how it came out.

>Why is this so? Are you in a low-population area?

Well, the city I live in is small but pretty dense, in fact my former
employer has set up a few high speed radio network connections in town.
I'm not sure what frequency they're on, but I'm guessing somewhere in the
lower microwave fequencies. We also have the annoying problem of being
situated in a valley, if you want to get out of the valley on *anything*
(2M or not) it requires an extra node at the rim of the valley. However,
outside of this valley the population is pretty spread out with lots of

hills and forests between them, microwave is going to have some problems with that.

BTW, don't interpret my opinions as being anti-high speed networking. I'm all for any improvements to packet, but I just haven't found a useful replacement for 2M AX.25 yet...

DAMA seems to be the emerging standard. I believe TheNet offers DAMA access now, in addition to FlexNet and XNet. There are probably others... While monitoring a local MSYS Node/BBS, I keep seeing the phrase "DAMA" included in it's I.D. info...

FlexNet has DAMA slave capability built-in as an option, and can be used to "drive" a good variety of packet software. (Term programs, Cluster, BBS, TCPIP)
If you utilize the FLEXDIGI node module, the resulting FlexNet node can operate as a DAMA master or slave as you choose, on a port-by-port basis. Or you can choose not to use DAMA, in situations where it would not be appropriate.

It's really easy to set up a FlexNet node as a DAMA master... The trick, of course, is get a significant number of local hams, and especially new hams to utilize DAMA-slave capable software themselves. If nobody is a DAMA slave, being a DAMA master is kind of a moot point!

It appears that a growing number of packet networking packages are offering DAMA, so it may be that Hams who do not care about it now will develop an interest in a few years, after they've had it in their faces for a while. The process of osmosis is too slow for me, but it's good to know it's there, chugging along anyway.

I like to think that the "soundcard TNC" driver that FlexNet offers may be a good way to get a large number of DAMA-slave capable stations on the air, particularly new hams. It requires a PC with a 16-bit SoundBlaster (or clone) and a PTT (Push to Talk) interface to key up the rig. There are 1.2 kb and 9.6kb versions of the driver, both included in the same package.

The PTT can come from a Com-port, a Parallel port, a Game port, or even from a VOX circuit which utilizes microphone audio to trigger PTT. The driver has provision to use any of these.
The Com-port interface is the simplest and cheapest though, using one transistor, one diode, and one resistor. I paid three bucks for those parts.

That means that for around four bucks, I could stick the parts and a schematic in a sandwich baggy, along with a floppy disk containing the FlexNet software and a term program. - In fact, I have done exactly that, with spare parts I bought in case I fried a component during assembly. It made a neat package, but I don't have it anymore because I couldn't resist the temptation to give it away.

If your club (or you) passed out enough of those $4.00 kits to new hams, you could probably get a deal on the parts or the floppies and end up doing it three bucks a pop instead, before you knew it. It would generate a lot of fraternal good will, of course, and give the new hams a sense of being "included" they presently lack, but that's just a side-affect. Most significantly, you would also rapidly end up with an established base of DAMA-slave capable packet stations in your area.

Most of these, at least at first, will be a mixture of the new hams and the more technically sophisticated hams. Good old osmosis will still be chugging along to eventually snag up the rest.

This is an inexpensive, effective promotional package.

It doesn't matter if you are promoting DAMA, FlexNet, Packet Radio, or just Ham Radio. You're not going to find this much bang for the buck anywhere else.

FlexNet is particularly well suited to new hams, because there is only one TNC parameter to set. FlexNet handles the rest of them, making setup very simple. The PTT interface is a great first home-brew project, too.

FlexNet is also well suited to experienced packet ops, because it performs better than anything else. That's fact, not brag. Again, FlexNet's adaptive TNC parameter control is the reason why.

Note: FlexNet can also be used with "real" TNC's and packet modems, and ethernet, ect. I decided to use Tigertronics "BayPac" modems for my multiport node.

For more info, go to my URL below, and press the "FlexNet" button.

Actually that question is very simple. Hundreds of Thousands of business
flyers wanting to use their computers versus the occasional ham nerd
wanting to use his two way. Money talks, and yes, Computers are a much
more serious threat, but the FAA is not concerned about safety, but
about airline profits.

I use a Bendix HF950 radio in our corporate aircraft all the time on the
ham bands. Only unfortunate part about most aircraft HF radios is that
they are only capable of USB or AM, so the lower freq ham bands are
unuseable with them.

This is not a great surprise, since low power 1.8/1.9 GHz cellular
phones work quite well in varying terrain.

There seems to be a common misconception among hams that microwaves
requires line of sight. I guess that this is from the fact that it has
previously been very expensive to generate any significant amount of
power in the microwave bands and typical transmitter power being in
the 1-10 mW range (e.g. Gunnplexers). The power budget has been so
limited that is has just compensate for the free space loss to a few
hundred meters or a kilometer with direct line of sight. Attempting to
use any indirect path has failed, since the power budget was already
very constrained at direct line of sight.

While using big parabolic reflectors to concentrate the minimal
transmitted power to a narrow beam (on Tx) and collect as much power
from the passing field (on Rx) extending the line of sight range to
any practical terrestrial line of sight paths or troposcatter (up to
about 100 km). However, to extend the distance further, there are
practical antenna size and aiming difficulties that limit the antenna
size and the beam will get too narrow to effectively illuminate the
common scatter air volume between the stations. Thus, there is a
practical limitation for reliable line if sight distances
(tropospheric lift conditions are not considered here, since they are
too rare) with minimal _transmitter_ power.

When looking at short or moderate distances, any V/U/SHF signal propagates quite well in urban areas via multiple reflections from buildings and other structures. However, the loss is usually larger than in free space. The signal will hit the receiver from strange hard to predict directions (often from multiple separate paths) so there is no point of using highly directional antennas neither to transmit nor receive. While a directional antenna increases the _apparent_ transmitted power (i.e. ERP) the total radiated power has remained the same, so the main issue for such "random path" communication is the available _transmitter_ power.

Take two of those miniature 2 m or 70 cm HTs with maximum transmitter power in the 100 mW range and with low power settings of a few milliwatt and set these HTs to the low power settings. With two people walking in the streets with these tiny HTs, you do not have to get very far apart, before the communication becomes unreliable. However, two mobile stations with 10 to 100 W transmitter power (30-40 dB more) can communicate at much larger distances.

A 1-10 mW microwave transmitter is in even a worse situation than the tiny HTs mainly due to increased vegetation and other soft object, so it is no wonder that the results are disappointing. However, if the available transmitter power could be increased by 30 - 40 dB, we would get a similar increase in coverage area in urban areas as going from a tiny HT to a mobile station at 2 m. If there is a lot of vegetation and a lot of low hills, the improvement would not be that good.

The problem with most such communication is that the signal propagates through multiple paths with different path length causing deep dips in the frequency response due to cancellation at certain wavelengths, when the path length difference is an odd multiple of the half wavelength. Simple broadband digital modulation methods are not robust enough against this, so usually some more advanced modulation methods are required to fully utilize the indirect paths.

Until reasonable priced transmitter becomes available with transmit power over 1 W at a few GHz becomes commonplace, the general misconception only propagate line of sight, while other services have long ago found out that it is not so :-).

Returning to the 2.4 GHz example in the beginning, a single sharp edged obstacle only attenuates (due to diffraction) the signal by 20-30 dB, even if the direct line of sight path is several Fresnel zones _below_ the top of the obstacle. For a 10 km path with an obstacle in the middle, the obstacle can be tens of meters higher than the direct line of sight path. Provided you have the extra power available and can cope with any multipath issues, I do not find that claim to be anything unusual.

It's 02 Jul 98 02:53,
We'll return to matt.green@shef.ac.uk and All's
discussion of Idea for New, Faster & Better AMPRNet & Packet Radio

ma> More services and possibilities, provide a full emergency situation
ma> comms system including audio & video over wide areas......

ma> Simple eh? Anyone interested? Reply here.....

Might be a place to start a feasibility study (or simply tinker :)).
From what I've seen, packet has changed little here in the last 5 or 6
years. Most users are still at 1200. What is needed is an affordable
and _home brewable_ high speed solution.

Software wouldn't be a problem, some programming guru could knock up
suitable drivers for Linux (if they don't already exist :)). Just need
the hardware to go with it.

Would also be a good way to utilise the higher bands, which are ideal
for point to point links and localised nets.

... "Because it's never been thought of that way!"-doesn't make it wrong.

we are actually looking at doing this here in the UK (we have a telco monopoly on net access, between 0.01 and 0.08 pounds sterling per minute) so it is an idea that has "come of age"

there should be an RFD out for a new NG in the next few days, it's with the UK esenet committee as we speak..

ther is a very interesting artice from september 1970 by A H Reeves CBE ACGI DIC CEng FIEE in a speech he made at the 69 Bernard Price Memorial Lecture about this, coined "SYSNOL" by him. believe there are several references on the net.

we have a slightly unique problem in the Uk due to bandwidth allocations, products such as freewave (www.freewave.com) apart from being a bit pricey at 1000+ US$ operate right in the middle of our GSM allocation

to date experiments within existing packet radio bands here have shown that the hardware and technology is mature, but TCP/IP just "falls over" at these low data bandwidths.

sorry if this is slightly off topic but I thought there were enough common points of interest to make it worthwhile.

cheers

GF

I can tell you how and where to connect inside your KAM if that's what you need. The SM230 I'm not familiar with, but if it has the standard oscilloscope X-Y inputs, you're all set. Let me know.

Wasn't there some obscure FCC rule that equipment meant for operation fo the aircraft/vessel was not allowed to be used for ham service? I never understood this, quite frankly, as in order to comply, one might risk some sort of hazardous lashup of ham equipment.

I've personaly QSO'd with two Navy pilot/hams on HF and they were using the onboard HF (naturally). One was on 10 meter line of sight (Navy carrier radar plane) and the other was a Navy DC-9 (forget the designator now) on 20 meters.

I've used a Wulfsberg Flexcomm on 2 meters from my company helicopter. Works exceptionally well.

I've asked the NASA boys who fly over my house frequently to get on 2M AM on schedule, but could never get them to get any energy around it. They scratched the 2Mtr FM/HT possibly because of the necessity of wearing an oxygen mask in a T-38. 225.000 Mhz is a common freq between their equipment and ours, but would be stretching the rules a bit I think because of the AM sideband excursions from the ham band.

In conclusion, I'd like to see more air mobile on the bands. Perhaps a calling freq on 10 mtrs?

73 and thanks for your comments.

Have asked before with no replies, so will ask again --

MFJ advertises a DSP addon board for the 1278. Does it
actually make the 1278 useable on HF? Does it help at all?
Is it worth the $99 (I think) they are asking for it?

Thanks

Please email me directly badger@telalink.net

Source record: 23379

The MFJ1278 is usable on HF (Pactor, Amtor, Rtty). I doubt the DSP add on (or anything else) will do much for HF packet. It's a front end audio filter which may help in QRM situations where the interferring signal is not strong enough to pump the receiver AGC. The biggest improvement is to use 500 hz filters in the receiver IF if your transceiver can do that (many can't). This way you get rid of the QRM before it gets to the AGC circuit.

Source record: 23282

Flamefest after flamefest after flamefest. Everyone wagging their weenies
to see whose is the biggest or biting each other back and forth.

I used to see ham radio actually discussed on these newsgroups, but if
one message goes against some folks narrow views, then all I read the
next month or so is the flamefest and namecalling that insues.

We sit back and make fun of the folks on 75 metre phone, we make fun
of CB'ers. But geesh, the 'net is not much better. I would almost rather
listen to the Liberty Net on 75 as attempt to actually get any info from
these forums.

Heck and THIS newsgroup used to have the least amount of fighting of
all of them.

Ahem.

I feel better now. Got it all out of my system. This will no doubt cause
another
flamefest, but think about it folks, when is the last good long thread where
actual INFORMATION PERTAINING TO HAM RADIO was discussed, instead
of questions of lineage or other personal epithets tossed about.

73

Tom Norris

2999. ti-92 with my TNC, the ultimate mobile packet station

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-04 00:00:00 UTC
From: qwasty@hotmail.com
Message-ID: <6njvm3$3vk$1@nnrp1.dejanews.com>
Source record: 23283

I have my ti-92 connected to my TNC's (kpc-9612 plus and PicoPacket w/ gps) using the standard ti graph-link cable (converts calculator data to RS-232), but I can't get any response from the TNC. I'm using a terminal program called Fterm on the ti 92 which comes with fargo. Has anyone done this before that my know what is wrong? Unless there's a problem with the software on the calculator or an incurable hardware problem, I am completely stumped.

Dear All,
I am working out how to mod a BOSCH KF163 PMR set for 2 Meter use. It has an RCA EPROM which holds the programming data. It is an 18U42CD. What is this, I have never heard of it. If someone has a device description they could send/fax/write to me that would be very useful.

Alternatively if someone knows how to do Bosch KF163s that would be a help.

Cheers

Paul,

I have a PK-232MBX, myself, though I haven't used it on Pactor yet. The AEA unit had an excellent reputation but AEA went out of business and Timewave took over their product.

I'm not sure of the status of Timewave (at this time) but I've seen PK-232MBX units for sale for around $100-$150 on this newsgroup. Make sure it has the Pactor feature in it as the original MBX series did not.

Source record: 23290

Is it possible to save the track history (driving around in a car with GPS and a laptop) in WinAPRS, like it is in DosAPRS? How can I do that? I can see myself on the map moving, but is it possible to save that track data for later processing, to make maps of my drivings afterwards? I can set the NMEA output logging into a file, but that's way too much data, it would fill up my HD too fast.

I am using a Kenwood TM-431A. I also use a TM-231A for the two meter 9600 baud. These rigs should be quite reasonable out there on the used market and are easily modified to run 9600 baud packet quite well. Both rigs have been in service night and day for the last few years and have been trouble free. Good luck!

Cheers!

Joe

>anybody who can sent me a copy of such a program via e-mail?
>
>
It isn't public domain, but there is a prog at my website that is shareware, fully functional with no nasty time-outs etc. It is called SUPERMORSE and it is the prog that got me up to 20 WPM. Very versatile. If you don't have web access let me know and I will email it to you.

Do be careful about accepting programs emailed to you which can contain nasty trojans that will make your computer email your passwords, credit card numbers, etc to other parties unbeknownst to you. Risky enough to download, but accepting emailed progs can be even more dangerous.

If you need to reply, please post to r.r.a.m. or email me as I do not normally visit this group anymore. I dropped in by accident trying to find a couple of posts I deleted from my pfc without reading and saw your post subject line.

>radio.

You're right, the KS900 is good, but it is plug and PAY ! You can now
find synthetized transceivers for just a little more money than these
tiny KS900 :

. 10 channels, PIC controled
. 6 W output
. 1k2, 9k6, and soon 19k2-ready
. 40 ms T/R switching (= txdelay 4)
. channel selection with BCD coding

There is only one drawback : this transceiver uses the European 430
MHz band : 430-440 MHz. Its filters don't allow a wider band at this
moment : no hope to use it in the USA !

>

Ah Ah, at last, there is someone in amateur radio who feels the need to do things rather than just buy the black box!!! This discussion topic seems to have generated some interest from those of you who have been thinking that something needs doing!

I agree with Tony's point above that "Home Brewable" is a good idea. Even if a small group of people come up with the idea, design notes and diagrams can be posted on the newsgroups/a web site/available by normal post for others to buy the kit themselves and assemble it, I know that microwave devices are surface mount but they are fairly easy to solder and I bet some enterprising people will knock boards together for the price of the parts and a few pints!

> Software wouldn't be a problem, some programming guru could knock up
> suitable drivers for Linux (if they don't already exist :)). Just need
> the hardware to go with it.
>

Same goes here as for hardware, there are enough professionals or even talented enthusiasts in amateur radio to write some good stuff. The RSPF automatic routing protocol is already part of the LINUX kernel!

> Would also be a good way to utilise the higher bands, which are ideal
> for point to point links and localised nets.

These bands are in fear of becoming taken by commercial needs. 10 years ago, the entire spectrum from 1500MHz could have been given to amateurs and no one would have cared less, now, the 1800MHz band supports multi-million pound (or dollar if you're not in the UK!) enterprises.

Soon, bands like 14cms and the 5.6GHz bands will disappear to the next generation wireless systems, who can blame the government for supporting

business and dropping amateur radio like a hot potato - business means
things for a country, amateur radio at present does very little!

>
> ... "Because it's never been thought of that way!"-doesn't make it wrong.
> --

I think you've captured the general mood of amateur radio here in the UK
with that sentence! is it the same down under?

3018. PacTerm 98 release 1.1, Public Beta on the web 07-07-98

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-06 00:00:00 UTC
From: Creative Services Software <support@cssincorp.com>
Message-ID: <#cxeXVQq9GA.211@upnetnews05>
Source record: 23302

A public beta of Pacterm 98, Release 98.08.01 1.1 will be on the web for download on 07-07-98 at http://wwww.cssincorp.com/pacterm.

This is the latest FREE update to Pacterm 98 users. Current owners of Pacterm 98 will find the following enchancements in this public beta.

1. Morse code/Sound ID on Packet Connect toggle
2. User defined sounds for ID
3. Right Mouse button menus on all windows
4. Addition of chat window on command window, for ease of sending commands to the TNC
5. GMON function added (toolbar and menu)
6. User defined MAXUSER setting on startup
7. Invert tones options on hf not packet modes setting sheet.
8. User defined Macro language (.i.e {call} DE {mycall} in a macro will send KF4WGU DE N4GDO, if those are the callsigns defined in the settings)
9. Option to minimize/restore all windows if main window is minimized/restored.

and much more.

This update also supports the Kam '98 and the 3rd port on the KPC-9612.

Bug reports with the public beta program should be sent to bugs@cssincorp.com.

Pacterm '98 is only $69.95 and may be purchased through Kantronics at http://www.kantronics.com
or at 785-842-7745. (Ask for Karen or Cheryl). Pacterm '98 is a true 32 bit Windows application for Windows 95, Windows 98 or Windows NT.

From: Judge Dredd <jivebunny@enterprise.net>
To: Richard Letts -- as control <control@usenet.org.uk>
Subject: RFD for moderated group <uk.net.access.radiomodem.public>

RFD for moderated group <uk.net.access.radiomodem.public>

Summary

group name <uk.net.access.radiomodem.public>
(committee to choose if this name unsuitable please)

to discuss creation of a UK radio modem based WWW access
network (moderated)

Rationale

To create a group where interested parties can meet and exchange ideas for the design and implementation of a radio modem based WWW access network.

Due to many factors, not least of which are UK radio spectrum usage and licensing restrictions, this is a UK specific subject.

As these radio modems will eventually form an interlinked network that spans the country, they will form a wireless backbone for the WWW, as well as offering free 24 hour access to that network for users.

There are no UK groups that address this issue. The closest deal with packet radio which is inadequate for the purpose. This is a technology that has yet to be perfected within the unique UK radio spectrum allocation system.

The broad aim is to establish not only a functional design, but to establish a set of standards whereby any new user can set up their own radio modem connection without compatibility problems.

Charter

The group will discuss the following aspects.

Designation of a suitable, unused radio frequency and modulation type that will permit TCP/IP transfer of files at an average bit rate in excess of 28,800 baud and to an average range of 20 miles.

Specification of a suitable hardware design for the manufacture of a radio modem that meets all other requirements.

Design and implementation of a workable solution to the error overheads associated with a radio (as opposed to wire) link.

Design of any additional protocols required to prevent transmission

errors and error correction routines from contravening
existing
TCP/IP or Internet standards, or otherwise causing
interference
outside the radio modem system.

Interface of radio modems with computer hardware and operating
systems.

Any other relevant topics that come to light as a result of
either
discussions or experimentation on the subject of radio modems.

The group will not discuss similar technologies, such as
packet
radio, unless the point made has specific relevance to radio
modems.

Advertising:
����
���� Short (less than 20 line) announcements of events relevant to
readers
���� are permitted; blatant off-topic or commercial advertising is
not.

Binaries:
����
���� Binaries are not permitted on this group, however references to
���� FTP-able material and Web URL's are welcomed.

Moderated

This group is moderated.

Moderator

John Bunt jb@surfbaud.co.uk (initially)

Moderation policy

Initially an e-mail with the group charter and a request to
comply.
possible follow up to abuse@appropriate

Proponents

John Bunt jb@surfbaud.co.uk
John de Rivas John@longevb.demon.co.uk

Procedure:
���� This RFD will be discussed in uk.net.news.config for 14 days. If
���� there is a large degree of support for the group It will be
���� fast-tracked otherwise a vote will be asked for.

Further Information:
���� There is a great deal of interest in this topic, we have already
� committed ourselves to running an initial test project in
Devon
� and we have gained extensive support from everyone thus far
� approached. If you have time you might like to look at the
� SYNSOL/SYNSPEC proposals, which were initially made over
� thirty years ago, but were impossible to implement at the
time
� due to technological factors.
� We wish to stress that this would be a communally owned
� and managed network, inkeeping with net traditions, and
� opposed to a telco bandwidth monopoly. At present there
� are no telco plans to introduce cheap (let alone free) net
� access to the UK public.

many thanks

JB �

Tom-

There are commercial pilots that do get on the HF bands. They may be "off duty", but seem to congregate together because of common interests. Some may also check in while in flight, I don't know. A friend of mine, who died a few years ago, checked into one(some?) of their nets.

I wonder if there are any news groups specifically for commercial pilots? Perhaps they would be found on the GPS news group, sci.geo.satellite-nav. Posting the question in such a place might get an informative response.

One guess is that your graph-link cable is a DCE to DCE cable, i.e. it is made to
connect two computers. You might try a null modem adapter to roll around the
RXD/TXD signals. You need a DCE to DTE cable to work correctly using a KPC-9612
(A DTE / modem device) with a PC.

Just a guess...

It's 03 Jul 98 02:55,
We'll return to n5pvl@texoma.net and All's
discussion of Idea for New, Faster & Better AMPRNet & Packet Radio

n5> DAMA seems to be the emerging standard. I believe TheNet offers DAMA
n5> access now, in addition to FlexNet and XNet. There are probably
n5> others... While monitoring a local MSYS Node/BBS, I keep seeing the
n5> phrase "DAMA" included in it's I.D. info...

I seem to have missed some of the thread, news this way has been
woefully unreliable of late. :-(

n5> FlexNet is particularly well suited to new hams, because there is only
n5> one TNC parameter to set. FlexNet handles the rest of them, making
n5> setup very simple. The PTT interface is a great first home-brew
n5> project, too.

I have fiddled with FlexNet, it and its soundcard drivers work well.
(I used parallel PTT, as serial ports are scarce as hen's teeth here and
I didn't have a printer at the time). Unfortunately, the package has
one drawback for me - it runs under DOS or Win 95, neither of which I
run, or forsee running (natively, every OS here can emulate DOS) here.
I'm yet to implement my new packet system, but it will be running under
Linux, because the Linux box is the one with a spare com port. Just
have to hack the old 1200 bps modem I have to get it to run (I've got TX
tuned, just have to get round to getting the RX side firing), then I'll
load up the Baycom drivers that are sitting in the kernel, ready for the
exercise. :-)

I don't recall seeing any mention of DAMA in Linux AX.25 docs, does any
support exist? I suppose if it becomes of significant interest, someone
will incorporate it into the code no doubt.

I've been just an observer on packet for a while, though I was an active
user several years back (until the monitor on my old XT back then blew
up, and I discovered phone modems :)), and have since sold the TNC I
used then. :-(

... Madness takes its toll. Please have exact change

Hi everybody...I have to create a node/gateway/PMS between 2 different
frequencies with 2 bay.
At the moment I'm using BPQ+TST, but I've some problems.
So my question is: could I use flexnet drivers to create this type of
system!?!?!? How could I set up the node!?!?!? And the gate!?!?!?

There is some node software similar to BPQ!?!? I know byr, but BYR
doesn't permits gateway funnction...

Many thanks in advance...

Hello,

if you're interested in FlexNet or XNet, two different mailing-lists
supporting these systems are available.

To subscribe, email to listproc@ham.ireste.fr, no subject, and the
following text in the message body :

subscribe flex John Smith (F6XXX)

Replace "John Smith (F6XXX)" with your own name and callsign.

To subscribe to the Xnet list, simply replace "flex" with "xnetlist".

An input from France:

Operating a Hamradio equipment from any aircraft is strictly fordibben in France.

The very generic French term "aeronef" is used in the law text, meaning that even a pourly-electronic-devices-equipped hot air balloon doesn't allow the licensed Ham to have fun on board...

The reason why ? Maybe to limit the radio coverage of a potential high altitude transmitter... the text doesn't give any reason why.

A friend from the radio club was asking whether or not a short wave *long* wire antenna hung to a flying kite would be forbidden, the question is left open ;-)

The "GPS-Based Frequency Standard" article in the latest QST tweeked
my CCW interest. If the one-PPS signal from a GPS unit was turned
into a phase-locked ten-PPS clock and used for CCW, it would greatly
simplify the computer decoding of Morse code signals assuming both
ends of the QSO were synchronized to GPS and using 100mS per dit.
There would always be a dit mark, dah mark, or space at the beginning
of each one-PPS edge which could be decoded with a DFT or FFT.

Given the above system at each end of a QSO, how does one automatically
compensate for the speed-of-light delay between the two stations? In
other words, how does one delay one's synchronous clock by the proper
variable amount for reception of CCW signals from an unknown location
that can't be heard by the human ear?

I assume this same question would apply to any coherent digital
signal.

The accuracy of the GPS clock is certainly significantly better than the accuracy of crystal clocks currently being used for timing in CCW. Given the width of a dit at 12 wpm I'm not sure propogation delay would cause significant timing errors. Even so, if you start a transmission with the syncronization dits then propogation delay is accounted for so long as it doesn't change. Depending upon the propogation path and frequency it probably does change over time. Remember, the path is via one or more bounces in the ionosphere and not point A to B along the earth's surface so it's very tough to predict accurately. Again, the changes are probably of little significance when compaired to a dit time.

I've thought about the use of GPS clocks before however, that means that the HF station is no longer independant of any infrastructure because it needs to receive the GPS signals. Of course you could always switch back to crystal clocks or plain old CW if the GPS signals were not available. Still, a very interesting idea.

You can convert the airborne equipment to ham use but then you may not reconvert it back to commercial use or use it as a joint ham and commercial radio as some people want to, this applies as I remember to all commercial equipment converted to ham radio use,that is once converted to the ham bands you cannot convert it back to commercial use. As for the airborne equipment since it is frequency agile it is not legal for public safety use in land mobile bands. With the Flexcom radios we made a land mobile version using the modules from a RT9600 and a control head that had preprogrammed channels in it, not the thumb wheel selectable version.

KA9Q NOS has been around, I know, for quite a while, and there's lots of information available about it-- so much in fact that it becomes difficult to find the particular "slant" on it that I'm interested in. I'd like to be able to find out whether packet radio can provide a viable alternative to the usual dial-up (or even cable modem) account with an ISP. I would want to be able to do what one can usually do with a dial-up PPP account (mostly involved with running client software that provides e-mail, Usenet, Web access, ftp, etc.).

As you may guess, I'm almost totally ignorant of what might be involved to make this work (assuming it even exists): A computer, TNC, and a two-meter transiever to start with, right? But then what? Find a BBS with a gateway? A repeater club? Is there such a thing as an ISP that's accessible over packet radio? I don't even know enough to ask the right questions. If some generous soul could point me in the right direction (assuming that there is one) for beginning some kind of intelligent inquiry, I would appreciate it no end. :)

First problem you'll run into is that packet radio is slow. Even the fastest equipment can't beat a good cable modem or even a good modem. In fact, most commercially availible stuff is only 9600 baud, faster stuff is availible, but it requires some work on your part to assemble and often costs a bit more, and that will only get you up to 57.6K at that. Microwave holds the possibility of going faster, but then you lose the ability to go mobile as microwave requires directional antennas and for all practical purposes can be considered "line-of-sight"

OK, assuming lack of speed isn't a problem for you, there's one major issue to contend with: lack of security. Encryption is not allowed in ham radio, so all your packets are out in the open for anyone to read. Passwords, email, etc are all wide open.

>

You'll need a computer, TNC, and modem. Commercial 9600 baud TNCs will run around $200 with the radio adding another $300 or so (can be much cheaper if you're willing to modify an older rig or use a dedicated packet radio). Also, you'll need to set up a gateway or find someone who already has set one up. This will require another computer, tnc, and radio, plus some form of internet connection.

Unless you have some burning desire to go mobile, I don't see packet as a viable alternative to traditional net access yet, but that doesn't mean it isn't worth doing.

For some basic information on packet, I invite you to check out my
yet-to-be-completed FAQ at http://www.csl.mtu.edu/~jpbialas/

I missed the original message so just a comment.

Some years back I had a conversation with a fellow on 2M over a distance of several hundre miles. He was was using a 1 watt hand held. When I commented that he must have some hight above ground he said he was at 40,000 ft. We had to end our conversation when he had to land at the Atlanta airport. Not sure what the company policy is on members of the air crews of airliners who are hams.

I have also takled to several other air mobile hams including an FAA examiner in route to do inspections.

Ron

I think that it is very interesting!

At least one other ham seems to have been down this path before. Bill DeCarle, VE2IQ, has been working on Coherent CW and BPSK on the lowfer bands for a number of years, and has got some very good results. Recently his emphasis seems to be on BPSK more than Coherent CW, for the obvious gains of transmitting 100% dutycycle and employing error correcting codes. I will have to go back and read up on how he achieves synchronization. I am pretty sure that in the BPSK case, he transmits special synch codes which have lots of phase reversals, and locks onto those. This is similar to the idea of transmitting your square waves.

As a matter of fact, I spent a little time looking up Bill's webpage, and came up with a rather interesting introductory webpage which indicates that generally CCW does send a string of dots prior to calling CQ. Check out:
http://www.n2hos.com/digital/g3irm.html

I think the harmonic convergence of several ideas could result in a simple, repeatable design for digital experimentation. I've pondered the possibility of a radio based around the R2/T2 modules by KK7B, a frequency locked VCO (the GPS route may be the simplest, most repeatable way to peform this) and a PC to perform the audio signal processing and synthesis. Starting with nothing, such a system could probably be created for around $600-$800 excluding the computer, which may very well be a "dumpster-dive" acquisition. I've done some preliminary experiments with audio processing under FreeBSD, it seems rather promising.

Yep. The calling station generates a known sync vector while the
receiving station steps through a series of delays while running an
autocorrelation function. When the function output peaks, the delay
is correct for that link.

The choice of the polynominal for sync vector generation has been
extensively studied for coherent digital signals. Different polynominals
are used against different channel defect conditions, IE gaussian noise,
bursty noise, multipath, etc. Of course, Morse is at a great disadvantage
here because it uses non-uniform symbols. By default you're limited to
a string of dits as the sync vector.

For a good polynominal, a sync vector length of 16 to 32 bits is usually
sufficient. For a simple string of dits, the vector length needs to be
much larger. Something on the order of 256 bits is probably about right
to give a reasonable chance of synchonization.

Once synced, you switch to steering from maximum bit amplitude. That's
easy with a fully voiced modulation like FSK or PSK, but is treacherous
for OOK and a non-uniform code. Burst noise can easily corrupt the steering
and force a resync in an OOK system.

A 100 ms dit is equivalent to a path length of 30,000 km. That's roughly equivalent to the longest terrestrial path (direct path, long path could be nearly twice that long). Lets ignore long path. Now if you're off by an entire bit time, you're back in sync again. The worst case is when you're off by half a bit time. So the range of delay adjustment you need is 0 to 50 ms. A step size of 1 ms will get you within 2% of perfect sync. That's probably good enough, so you need 50 steps of variable delay.

Yeah, that's the problem with OOK Morse, the symbols aren't uniform, and
the modulation isn't fully voiced. That costs 9 to 13 db in ultimate weak signal
performance at the same sending speed against a uniform code and fully
voiced modulation like FSK or PSK. And it complicates acquiring sync
something fierce.

But if you want to do CCW, there are software programs available to let you
do it. Coherent started out as a CCW program, but switched to ASCII and
PSK for much better performance. They've now added a simple FEC to it
too, which improves performance even further. There are other CCW programs
available too. See the Longwave Club of America software download pages
for them (I think there's a British CCW group too, I recall seeing a column on
CCW in the Digital Journal by a Brit). You *can* do CCW in hardware using a
bucket brigade shift register as a synchronous switched capacitor filter, the
circuit developed by Petit used to be in the Handbook, but it is lots easier to
use a sound card's A/D and do it in software.

>Hi Mark, I think a PC running CCW could run circles around any human being.

Most humans maybe, but not all. It's not a matter of insufficient technology in the computer, it is a matter of bad code and modulation design. A skilled human can work down to the limits of the OOK Morse code and modulation design nearly as well as an optimum computer can. If you use a fully voiced modulation and a uniform code now, then you have something that can run rings around any unaided human being in regard to weak signal performance, because there is more potential in the uniform code and fully voiced modulation to be exploited, and a computer can exploit that extra potential better than an unaided human can. Something on the order of 9 to 13 db better.

Actually, I find the speed quite acceptable at 1.2K for regular text connections. Files transfers drag on, but I wouldn't lable it as "unusable". It really kind of depends on what you want to do with TCP/IP, web browsing and real audio type applications aren't a very realistic prospect for amateur packet radio as it stands right now, but I've had quite a bit of success with telnet, ftp, and good ol' gopher.

Granted, I've been operating on pretty clear frequencies, I'm not sure how well TCP/IP reacts with high traffic levels, but I suspect it can manage.

The only gripe I really have is that most amateur networks don't take advantage of TCP/IP's benefits, so the effort involved in setting up a TCP/IP node doesn't really get you any benefits over an AX.25 node.

Not sure whether this would apply, but I have run tcp/ip over a modem on
a noisy phone line where only 1200 baud could be supported... => high
error rate and low bandwidth. Worked great for normal networking kinds
of things, but wouldn't be of any use whatsoever for bandwidth hogs like
the Web.

I'm probably over my head here<g> but...

What about using MCW? Amplitude modulate the CW carrier maybe 70-80%
with a sinewave locked to the system clock? Maybe have it start at
50Hz at the start of a clock period, and gradually change to 25Hz
during the clock pulse?

Probably not legal in the CW bands in the U.S., but should be legal in
the phone bands, and certainly on VHF. 50Hz would be a reasonable
comprimise between accurate synchronization and keeping the bandwidth
down?

This is because the "benefits" are simply not that impressive. You hear a lot about how great it is, but when you actually use it... (Yawn)

A lot of hams are starting to figure out that amateur tcpip is mainly hot air and excuses. Sure, if you spend enough bucks you can come up with something as fast as a normal connect through an ISP, but "fast" is not the whole thing. Hams are severely restricted as to what kind of info they can transmit, and the "filter" systems we have now are both labor intensive and unreliable. You end up being severely restricted.

Hey, when I want to do TCPIP, I do it over the telephone. It works just great.

It's worth as an Amateur Packet Radio protocol has been greatly exaggerated.

Source record: 23247

In trying to make the transceiver control of XPWin work, I discovered I need the 'IC-10' interface kit for my Kenwood TS440S.

Examining the 440 instruction manual, it says the IC10 kit consists of two IC's, an NEC uPD8251AC (or equivalent), or a TC4040BP.

The 4040 is no sweat. I ASSUME the uPD8251AC is just a licensed copy of the old Intel 8251 USART. (If I'm wrong, please correct me!).

The local electronics store (one or two steps above Radio Shack) doesn't carry it, nor is it in the Digikey catalog.

Anyone have any suggestions where I can locate one? I tossed my last one about 10 years ago...

Thanks in advance - Orv - W6BI

As always, (it seems!) the FUNET archive is the place to go. There's
all kinds of morse tutor software there - more than I've been able to
try out!
ftp://ftp.funet.fi/pub/ham/morse/

One of my favorite DOS programs is:
ftp://ftp.funet.fi/pub/ham/morse/autocw.zip
It's freeware, donated in the spirit of Amateur Radio, and the guy did
a fantastic job, too!

There are also two other tutors in other directories, although I haven't
had a chance to check them out:
ftp://ftp.funet.fi/pub/ham/exams/mor21.zip
ftp://ftp.funet.fi/pub/ham/info/mrx.zip

I would still say a commercial service would be your best bet, unless you would be happy with (slow) E-mail only.

If you can handle the limitations inherent in trying to get Internet access via Amateur Radio, keep in mind that there is little (or no) TCPIP activity on the HF bands you will be using offshore. You'll be hooking up to somebody on PACTOR, CLOVER, or whatever and they in turn will have to hand-transfer your E-mail back 'n forth between the Ham and Internet networks.

That sure is a lot of trouble for a small return in my book, but perhaps you will be more easily satisfied. If it was me, I'd spring for the real thing. Talk to the other boat owners to find out what works best.

There's a lot you can do well with Ham radio on a boat, but unfortunately TCPIP is not one of them.

Yep, but wouldn't it be fun to beat Dick, Larry, and Michael at CW with a computer?
My ARRL Handbook sez that CCW can have a 20dB advantage over CW. Imagine a
computer copying CCW that Dick can't even hear. :-)

BTW Gary, did you ever get your sound board digitizing audio from your transceiver?
After August, I will be able to contribute to your digital effort.

Source record: 23252

Well Ted,
It can be made to work. I am running the same setup, as well as a plus with 8.2.
I had fun on several fronts.
I out smarted myself at one point with the cable rolling the wires from the db9 to the db25, but that happens automatically, so pin 2 of the db9 (gpsII end) to pin 2 of the db25 (rx to the kpc3)
pin 3 of db9 presumably to pin 3 of tnc, mine is open, but it works without it.(tx from the tnc)
pin 5 of db9 to pin 7 of db25 (gnd)

even when you get all that set up, If you have run the system in host mode, either on purpose or accidentally, you may have to reset it to get loose from the host mode. remember, when you reset, it comes up 1200 baud, thats ok if you pop in an asterisk or 2 to the gibberish that starts. the timing on that can be pretty critcal though.
there is a lot of "almost right info" out there.

I find it easier to program the device with the terminal mode fromWinaprs, but that may be ugly to get to if you aren't already familiar with it. you may also be better off with programming the tnc (if you are using it as a tracker,) with the hyperterminal or some other terminal software. Pacterm wants all the handshaking (not happy with my open tx line) and there is this junk where when you do certain things, you get hearts on the screen instead of the command line. messsy

Aha,
I assumed you were trying to set up a tracker, if you are trying to set up the hsp setup, there is a whole other adventure, but I have that working too.

some leads:
http://www.kcaprs.org/kpc3.htm

not sure if you are interested in the programming details, and if you are trying to tie it into winaprs, dosaprs, or as a tracker.

I presume that if you sample long enough, using your synchronous clock, you'll eventually find a potential point somewhere within the second where there would be an edge (this is assuming you know the signal is there, but don't know the delay). What you really want is for the dots / dashes to occur synchronous with the clock, and not the spaces. If this was the case, you could integrate for as long as it takes to discover the leading edge of the dots or dashes - you could use conventional time domain techniques (synchronous A-D) or FFT, I would guess.

Timewave offers complete support services for the PK-232MBX and other PK series data products formerly produced by the now defunct Advanced Electronics Applications, Inc. of Lynnwood, WA. The services include firmware upgrades, repairs, and tech support. The firmware upgrade kits can be ordered directly from Timewave. Timewave dealers carry new Timewave TNC's, Pakratt software and DSP signal processors. You may contact Timewave at 612-452-5939 or sales@timewave.com.

Please note all AEA antenna and antenna instruments now are made by the AEA Division of Tempo Research, which has no affiliation with Timewave Technology Inc. AEA/Tempo is located in Vista, CA.

Thank you,
Randy Gawtry, K0CBH
Timewave Technology Inc.

And of course, once you did achieve a lock, you'd know how far away the guy
sending was. :)

Synchronization is always the big problem with any coherent detection
scheme. Generally the approach would appear to be "spend time doing the
initial synchronization, then use drift-free clocks to stay on target". The
GPS based frequency standards would seem an excellent way to stay on target
once locked.

The synchronization task is probably not aided much by the fact that we are
using Morse. Much of digital communications seems to be in creating codes
which have good synchronization properties. Of course, coherent CW might be
a good technology demonstration, especially if the necessary hardware can
be brought down into palatable prices that can be constructed successfully
by amateurs.

Heck, might even get me enthused about Morse. :)

Hi Mark, I think a PC running CCW could run circles around any human being.
The PC could certainly generate the coherent clock given a one-PPS signal
from the GPS unit so it is the only additional hardware required. Maybe
the synchronization, instead of being a CQ, could be a few seconds of
square wave 100mS pulses. Anybody hearing that would instantly know
that a CCW CQ was being sent. Whadda ya think?

Hi,
Does anyone else hear a strange signal that covers about 6950 to 7050 kHz, almost 24 hrs/day, that sounds a little like the sound a turkey makes? I have determined that it is a series of tones in seemingly random order, each one on for 20-30 ms, on different frequencies as close as a few hundred Hz, but since they are spread over such a wide range, the complete transmission does not fit in my receiver bandwidth.

The signal transmits in bursts about one second long every 45 seconds, and seems to fade out for a while at local midday. During the evening here in northern ZL it is about S8-S9.

I would be VERY interested in hearing from anyone else who hears it, preferably with their location, the signal strength and if possible, a bearing. If anyone actually KNOWS what it is and who it is, I'd like to hear the details too. Our local Intruder Watch has been unable to identify it through official channels.

Email me as149@detroit.freenet.org

Alan,
Until the reorganization process moves along a little further (probably 1 to 3 months - dictated by the legal process), we won't be able to set a new delivery schedule. Expect some updates on the website in the next few weeks, but likely nothing further on the DSP-2232zx at this time. Interest in the DSP-2232zx is very high, and we're trying to move it along as fast as possible under the circumstances. Rest assured - when we have new info, we'll make it known!

I disagree. I *know* TCP/IP is superior to AX.25 when setting up large networks. Bridges, gateways, backbones, subnets, etc are much easier to pull off in TCP/IP than in AX.25. But, I've yet to see a single amateur TCP/IP network take advantage of any of those things. I also think the software could use some improvment. KA9Q was a great start, but it's getting old and all its *NOS derivatives are pretty poor in my opinion.

Someday, when I have time.... (probably in a good 40 or 50 years when I retire <G>) I'd like to write some TCP/IP software to make TNC act like a regular network device under Linux, none of this NOS stuff.

>A lot of hams are starting to figure out that amateur tcpip is mainly hot

I think a common misconception is that TCP/IP=speed. That's not really where the benfits of TCP/IP are, in fact AX.25 will always be faster. The benefits are in TCP/IP's ability to handle large networks and I've yet to see anybody take advantage of that.

Yes, it's ironic that the main "accomplishment" related to amateur Radio
which is commonly attributed to Amateur TCPIP devotees has been their
efficiency at undercutting the already global Ham Radio Digital Net by
imposing Non-Ham links (usually Internet) which displace and discourage RF
networking.
In other words, Amateur TCPIP appears to be a major damper on large-scale RF
(Ham) networking.

Are you saying that if the Amateur TCPIP community had tried cooperation and
participation instead of juvenile, nhilistic "hacker tactics", then we might
at this moment be using TCPIP worldwide, instead of in the little isolated,
insulated LANs the High-Speed morons have imposed upon it with thier
propaganda?

If so...

Haw Haw Hawr! Serves the idiots right for being jerks.

I seriously doubt packet is being undermined to the extent you would have us to believe Charles. I think a valid conclusion could be reached if you would provide us with a listing of link pairs completely linked by wireline, wireline links with radio backups, and link pairs totally dependent on radio. Such a survey would be able to indicate the amount of population that would lose service if all wirelines suddenly failed versus the number who wouldn't. I doubt the number would be significant, which is not to mean I wish these people to not have the ability to communicate, but if they didn't have the wirelines, would they have radios in the place of the lines? Judging only from the assertion that if one used a wireline anyway, I would doubt they would use a radio, whether the wireline existed or not.

Also, if we could hub some research on your link list alone, we could discover locations where the community at large could band together and get radio communications for wireline linked areas or areas without links at all. It would be much better than continuously complaining about the wireline links.

>
> I seriously doubt that. If you had enough interest in the Packet net to have
> kept up with things, you would not be asking for "proof" of something which
> any reasonably well-informed packet op has known for years.

Should I? No I shouldn't, especially taking into consideration your
so-called facts that the radio network already in existence works
perfectly and covers the entire planet. Everything into my region as to
BBSs is radio to my knowledge.

>
> Try being clever enough to look at that "list of names" (The LandLine Lid
> List on my Web page..) and you will have in your hand all the evidence you

> suffering from the antics of "Digital Communications Hobbyists". (LandLine
> Lids)

Your list of names is irrelevant, given your track record in the past.
Come up with call sign link pairs that are wireline in the three
categories I proposed, and we will draw a map. I have people that can do
this as a favor on GIS.

>
> TCPIP is used in every instance of "Internet Forwarding", you dope.

I didn't say it wasn't, you missed the whole point entirely. You haven't
proved that this forwarding is taking place to an extent that it matters
to the grand scheme. If you refer to your piddling net in Texas, Texas
doesn't stand for the country (however arrogant Texans are). It is clear
that you are assuming alot about the BBS mail transfer system and
internet involvement. Put some facts up or shut up.

>
> Hey I've got an idea that might be better... Why don't you do all that

> yourself? Remember: You're the one who doesn't comprehend the Packet net.
> It's your responsibility to correct that deficiency, not mine.

I'm not the one contending that we are being undermined, you are. For me to prove your point for you is idiotic. If you need to make a point, you bring your on facts. You're the one making the point, yet you have indicated no facts, except some politically motivated LLL list on your web page. That isn't good enough Charles, I want real link pairs, you know, a census, not a good ol' boy recognition list that more than likely has its own entire political landscape that previously had nothing to do with IPF.

>
> I don't have a "theory" about TCPIP geeks destroying the Packet net. It's an
> observed fact.
>

Not really, you don't even reply to your own packet email, or give some laim excuse as why you didn't get it. I'd say you were Lid #1, if there ever was a definition of one.

Gordon West Radio School Presents:

Two
General 13-wpm Morse Code
And Theory Review Classes

October 10th & 11th 1998 (San Diego, CA)
and
November 21st & 22nd 1998 (Long Beach, CA)

General 13-wpm Morse Code and Theory Review Class - 10/10/98 and 10/11/98
==========

Location: West Marine, San Diego, CA.

This class is for mariners that want to upgrade to the General Class license, but like many people, find the 13wpm Morse Code requirement their biggest stumbling block! Make 1998 your year to upgrade. Don't let the Code hold you back any longer, the Worldwide HF bands are waiting for you. In fun, stress-free way, your instructor will take you from a shaky 8-wpm all the way up to 13-wpm, or higher, in preparation for your exam on Sunday afternoon! Techniques in passing the CW exam will be taught, and there will be multiple demonstrations showing just how easy it is for YOU to pass the 13-wpm, or even the 20-wpm code exam! Theory review sessions are held throughout the two days to help make passing the written exam even easier. Students that pre-register will receive the Gordon West "General Class" textbook, Gordo's exclusive CW tapes, and a special pre-study package. The class fee includes sixteen hours of tuition, beverages and lunch on both days and a barbecue on Saturday evening. General Class students join Gordo and his No-Code Technician class for an operating session and workshop dedicated to installing, using and maintaining ham radio equipment aboard yachts and powerboats.

General 13-wpm Morse Code and Theory Review Class - 11/21/98 and 11/22/98
==========

Location: Kenwood Corporation, Long Beach, CA.

Are you a terminal tech? Have you tried to pass the General Class code test before on your own? Have you "hit the wall" at 10-WPM and need help over the "plateau"? The General Class code weekend course is your answer to the Technician Class blues! The new "no code" license offers no privileges for worldwide communications. You will need the General class ticket for worldwide voice DX. Gain voice privileges on 10m, 12m, 15m, 17m, 20m, 40m 75m and 160m! Build your code speed up to 8-WPM now, then pass the 13-WPM, or even the 20-WPM code test in class on Sunday 22nd November! This is the fun and stress-free way to upgrade.

--==--

Both weekend courses include:
o Beverages, snacks and lunches
o Saturday night "Operating Session" with Gordon West
o Home study package consisting of CW tapes, book and
computer software
o Audio tapes for home study
o Sample test preparation exams, just like the real thing
o Multiple code test-passing opportunities

Only Prerequisite: All students must be able to copy code at 8-WPM prior
to coming to class.

For full details on either of the classes described above, please call
Gordon West at (714) 549-5000 between 10am and 4pm, Monday through Friday.

>It's already in Linux from 2.2 onward. NOS is obsolete except for those
>poor souls still using DOS.

Actually that's 1.3 onward although there were patches for earlier
versions. 2.2 isn't out yet. Drivers exist for KISS TNCs, Pi, PacketTwin,
8530 SCC, Baycom, soundblaster, etc., and there is support available for
NETROM, ROSE and FLEXNET as well as vanilla AX.25.

The LandLine Lid List

(Regularly updated from N7QDN's list, as seen on the Packet Radio network.)

Stations forwarding Amateur Radio bulletin traffic via the Internet. Radio Operators who avoid these stations will help rebuild our radio network.

US Callsigns:

LandLine
>> Lids)
>
>Your list of names is irrelevant, given your track record in the past.

I'm disappointed that you didn't have the intellectual integrity needed to
follow the simple tasks I outlined for you. If I were in your position, I
would be afraid of the facts too, so I can't say your lack of snap is very
surprising to me.

>Come up with call sign link pairs that are wireline in the three
>categories I proposed, and we will draw a map. I have people that can do
>this as a favor on GIS.

Yah Yah, Blah Blah.

Look at what you've been shown, cowardly David. Quit groping for excuses to
avoid the truth.

>> TCPIP is used in every instance of "Internet Forwarding", you dope.

>I didn't say it wasn't, you missed the whole point entirely.

"ATCPIP will have no effect on these numbers, ever.", is what you said, David.

>You haven't
>proved that this forwarding is taking place to an extent that it matters
>to the grand scheme.

No, but I gave you the tools to prove it to yourself. You lacked the snap and integrity needed to pick them up and use them. By the way, I just asked my nine-year old daughter (non-ham) to do the tasks I outlined for you. She had no trouble at all.

I bet the Hams on this reflector will have no trouble following them, either, and I would like to encourage them to do so. Let us know what you find, guys, that David was so afraid to look at. To facilitate that purpose, I posted the "LandLine Lid List" here.

Step up! Check it out for yourself!

>If you refer to your piddling net in Texas, Texas

Several times larger than any Amateur TCPIP net in existence, including the one Gary brags about at every opportunity. So if TexNet is "piddling", what would we call Gary's much smaller TCPIP LAN? :-D

>doesn't stand for the country (however arrogant Texans are).

(Ahem...)
Well, I can't help the fact that I am more fortunate than others. Not everyone can be a Texan. After all, what would be the good of being a Texan without non-Texans to look down on? This is why Texans have not annexed the rest of the globe, and are satisfied just to have a larger than usual piece of it. Those other little places and people provide contrast, diversity, and unending amusement to those of us from "God's Country", and we Texans appreciate the terrible sacrifice unfortunates such as yourself must make, living in those other little places... ;-)

Keep it up!

>It is clear
>that you are assuming alot about the BBS mail transfer system and
>internet involvement. Put some facts up or shut up.

I gave you the facts, but you were too cowardly to follow that lead and verify them for yourself. You lose.

>> Hey I've got an idea that might be better... Why don't you do all that
>> yourself? Remember: You're the one who doesn't comprehend the Packet
net.
>> It's your responsibility to correct that deficiency, not mine.
>
>I'm not the one contending that we are being undermined, you are.

Actually, you are the one contending that we are NOT being undermined... Where's your facts? Remember that I am an experienced BBS SYSOP, talking about the BBS forwarding network. You are a TCPIP geek who can't even handle the User end of a packet BBS, not to mention the rest of it.
... But I won't argue who has the burden of proof. It's a moot point, since I have already provided the proof for you, along with a mechanism for verifying what I had to say.

>For me to prove your point for you is idiotic.

You've always been comfortable with that in the past...

>If you need to make a point, you bring your on facts.

I brought them on, but you weren't up to the task. You lose.

"You can't Handle the truth."

>You're the one making the point, yet you have
>indicated no facts, except some politically motivated LLL list on your
>web page.

Politics ???? An Internet Forwarder is an Internet Forwarder, whatever his/her Politics.

Yep, the list is quite valid... You say it's not? Where's your facts?

>That isn't good enough Charles, I want real link pairs, you
>know, a census, not a good ol' boy recognition list that more than
>likely has its own entire political landscape that previously had
>nothing to do with IPF.

I take it then, that the task of looking at BBS message's R:Lines was beyond your capability? (Where link pairs are indicated) I can't say I'm surprised. You probably are not entirely clear about what a R:Line is, are you? If you are too embarrassed or proud to ask for help here, try one of the local Hams.

I gave you facts and a means to verify them yourself, and you cry "politics". You lose.

>> I don't have a "theory" about TCPIP geeks destroying the Packet net. It's an
>> observed fact.
>>
>
>Not really, you don't even reply to your own packet email, or give some
>laim excuse as why you didn't get it. I'd say you were Lid #1, if there
>ever was a definition of one.

Oh yes, Internet Forwarding is an "observed fact", for those who are not too busy sticking their heads in the sand to observe it. Pop out and join us some time.

Did you try to send me a packet message? When? Have you got a callsign? If so, I can look in my BBS and see if something from you is in there. My own

personal messages "live" forever on the BBS. They are not deleted, so if you sent me something in the last few months, (Date of last major software upgrade) it should be in there.

You can always try again... When you get your reply, have a Ham show you the "R:lines" so you can see the Internet Forwarder (LandLine Lid) callsigns which will be there. Keep your copy of the LandLine Lid List handy, and you'll quickly begin to see what I have been talking about. If you can handle it.

Tell you what: I'll challenge you to send me a packet message which does NOT go through an Internet Forwarder along the way. I say you can't do it, and that right there is all the "facts" you need to understand that Internet Forwarding has significantly affected the integrity of the Amateur Radio Digital RF Network.

My bet is that you'll whine some more, and stick your head even further in the sand instead... Why?? Because that's just the kind of guy you are, David.

Pathetic Wretch.

For POCSAG pager decoding look around for a copy of 'poc32eng'.
It's a great piece of software that uses a soundcard to decode
pager signals. You will also need a direct discriminator connection
to your receiver, since the audio section mangles the signal too much.

There are other packages that do pager decoding, but poc32eng is
the best of the bunch.

Source record: 23090

Hi I have been reading about multilevel modulation(like using 16
different phases
and 4 different amplitudes to transmit data) and I was wondering if anyone
has
experimented with it on VHF and UHF. I know that Clover II uses it and is
very
efficent and fast. What if we took it up in freq. and cranked up the baud
rate?
While searching on the net I found sites dealing with 1024qam(WOW, fast ,but
probably
doesn't do good with interference) and stuff up at 450MBPS.

My second question was if anyone had DSP software for a computers sound card
that you could program experimental data modes into? This would make a cheap
alternitive to designing and building new types of modems before we even
knew if
it's experimental mode would work.

Example:
A mode running 32FSK and 32ASK at 12,800 baud. That would allow a data rate
of 128,000bps(ISDN speed) on 2m or 70cm!!!

I'm curious why you didn't just upgrade the firmware in your KAM
rather than spend the extra dollars for a new unit.. I purchased
mine back in 1984 when it was at v2.82, then had upgraded it over
the years to version 3.0, 4.0, 6.0 and now ver 8 with the
enhancement board. Yes, the KAM+ has an extra LED for the mail
waiting light but the KAM enhanced does all the same functions..
Mine now does G-Tor, Pactor, G-mon, PT-listen, and the new
"TOR" monitor mode where when the unit is called by another
station, it automatically switches to the protocol that is
being used by the calling station, and has GPS support
for APRS..

anyway, just wondering..

Salut,

Est-ce pour le PK232 ??? if so, then I already answered you. On the other hand, si tu recherches un logiciel fonctionnant sous MS-DOS, je n'en connais pas. Ta demande est contradictoire... tu recherches de quoi fonctionnant sous Windows (3.1, 95 ou 98), mais tu veux aussi qu'il soit simple et petit ;-)

Alors... est-ce pour le PK232 ou pour un KAM+ (KaWIN lite) ???

Michael,

16P4A is used mainly for HF (good paths). CLOVER-2000 uses this mode, with 8 tones, resulting in a 3000 bps data stream (Clover-II is limited to 4 tones).

Concerning "high-speed VHF/UHF"... remember that FCC regulations limit the data bandwidth on 2m and 70cm. To attain your data rates, you would need to operate much higher in frequency.

Also, remember that data rates can be increased by the efficient use of pre-transmission compression (well, ok, I call it "perceived data rate"). After all, if you are a user and exchange a 100k file over HF in a few minutes, you will think that the data rate is extremely high... in reality, this 100k file could have been compressed to 20k and sent at 3000 bps... thus the term "perceived throughput" ;-)

Unfortunalety, I don't know of any low cost DSP programs that you are looking for.

Try my website for links to high-speed HF modems ;-) It's at:

http://www.users.cts.com/sd/b/bhaineau/index.htm

No, MCW isn't a good idea for weak signal work. First you have to
demodulate the AM or FM signal, then you have to demodulate the
on off keyed audio subcarrier. The latter is the same problem that
you faced with CW alone, and the former requires a much better
SNR than would direct CW . So the combination is worse than either
used alone.

Ideally, what you want to use is some form of FSK or PSK. FSK has an
advantage in multipath enviroments where phase coherence can't
be maintained over the path while PSK has an advantage against
pure gaussian noise (a 3 db advantage over FSK in an ideal gaussian
noise environment). That's why a form of PSK, IE BPSK, is used for
deep space probes. That's a pure gaussian noise environment,
and the 3 db advantage allows spacecraft power consumption to
be minimized. (If the space probe used OOK Morse, it would suffer
a further 9 db penalty, which is why we don't see ranks of Morse
operators at NASA copying signals from space probes.) When
operating well below the MUF, the HF skywave path's defects are
dominated by multipath. So we want to use FSK on HF (particularly
at night on 80m where the multipath delays can approach the symbol
duration).

It can be shown mathematically that any demodulator is equivalent
to a matched filter and a decision circuit. So it doesn't matter the
exact form a system's demodulator takes, it can be analyzed as
if it were a matched filter demodulator. And its performance is
inversely proportional to the width of the matched filter. And that
in turn is a function of the modulation and coding used as well
as the speed of transmission.

The problem with Morse coding is that you can't form a matched filter
for it. That's because there are 5 symbols (only 2 voiced), and they are
of different durations. With a code using uniform symbol durations,
you can form a matched filter for it, and so can, in theory, do a perfect
demodulator for it. With Morse's irregular symbols, you pay a 3.98 db
penalty for the unequal lengths of the code symbols.

The problem with on off keying is that not all of your symbols are
voiced (represented by signal energy), and thus your decision
circuit has to *infer* their presence against the noise background.
That costs 6 db in ultimate weak signal performance compared
to a fully voiced system. So OOK Morse is now down a total of
about 9.98 db from a more ideal coding and modulation.

CCW doesn't address the latter problem, but it does address to some
extent the former problem by windowing Morse symbols with a uniform
sampling window. This lets you do a pseudo-matched filter. This gives
you a near 4 db advantage over ordinary OOK Morse.

Now the ideal form for a code symbol is the raised cosine. That minimizes
the required symbol bandwidth and allows you to use the narrowest possible
matched filter. Morse is usually modulated using half squarewaves of differing
durations. That requires a wider filter in order to pass the odd order harmonics
making up the waveform in order to recover the maximum amount of signal
energy in the demodulator. For ordinary Morse keying, the CCIR recomendation
for waveform shaping sets the minimum filter width at 66 Hz for any keying
speed. (At high sending rates, the dot rate sets bandwidth, but that's at
speeds beyond the human ability to decode, and isn't appropriate for weak
signal work anyway.) Use of a narrower filter will degrade performance.

We can drop that required bandwidth significantly by going to raised cosine
shaping of the modulating pulses. It won't sound like OOK Morse to the ear,
but to the energy integrating matched filter detector it will give us the best
SNR we can achieve with OOK Morse. Of course more advanced systems
like Clover II already use raised cosine pulse shaping as a matter of course.
Using raised cosine shaping with CCW would allow us to narrow the pseudo
matched filter to 10 Hz. That would pick up about 8.2 db compared to incoherent
OOK Morse. (We actually don't gain that much in practice due to the irregular
symbol lengths of Morse. Windowing helps, but not that much. The filter is
still too wide for the longer Morse symbols.)

Note that I'm talking about the baseband signal above. There's also the problem
of the AM modulated carrier for OOK. That has to be demodulated to recover
the baseband signal. OOK is double sideband with carrier AM, using a modulation
factor in excess of 1 (alpha/Ao). This results in carrier cutoff during negative

peaks of the baseband, thus the OOK nature of the signal. DSBWC modulation pays a 9 db system gain penalty with respect to SSB. So if we were to use SSB modulation for the Morse baseband coding, we could gain an improvement.

This *really* wouldn't sound like OOK Morse to the ear, in fact to the ear it would be at a frequency so low that it would be virtually inaudible (all you'd hear would be the state transitions), but to a machine system it would be a strong gain in system efficiency. CCW as practiced today doesn't do this, but it could. (But note that using raised cosine symbols negates this latter advantage to a large extent by suppressing the transition edges, IE we can do one or the other, but not both.)

Note that I've tossed out a lot of db figures above. Realize that all of them don't directly add (IE they aren't always apples to apples). Naively, it may appear that CCW could out-perform an ideal PSK modulation if you sum all the numbers, but it doesn't work that way. There's an irreducible 5.98 db advantage for PSK (in a pure gaussian noise environment) and 2.98 db for FSK which can't be overcome with any on off keyed signal.

So we're always going to do better with an optimized PSK or FSK system than we are with any OOK system. And in terms of machine implementation (and we have to use machine implementation to get most of the advantages) FSK and PSK systems are simpler to implement. So unless you just want to do it, there's no real reason to do CCW. It beats ordinary CW, but a properly designed FSK or PSK system at the same information rate will beat either one of them.

And I haven't touched on the coding gains possible with FEC. That can be substantial for signals above a detection threshold, IE system gains of 20 db or more. It isn't practical to implement FEC in a Morse system, but it is easily accomodated by the sorts of protocols typically used in FSK and PSK systems.

In summary, for weakest signal operation, we want to use an information coding with uniform symbols (which Morse is not), and we want to use PSK if we are facing a pure gaussian noise environment, or FSK if we are facing a multipath environment. On off keyed Morse always loses at a given information rate. That sounds unbelieveable to many amateurs whose on air experience says that Morse gets through when nothing else will, but that's just because everything else they've used has been at a higher information rate than OOK Morse.

Shannon tells us we have to trade information rate for SNR. And when we compare systems at the same information rate, OOK Morse always loses to uniform codes and fully voiced modulations, because the latter hold a SNR advantage over OOK Morse. That's why OOK Morse has been abandoned for mission critical applications by the military and commercial services. (Amateur communications typically isn't mission critical, so we don't have to care about that if we don't want to, but we should realize it is true.)

I consider CCW a novelty. It doesn't bring to the table anything we can't do better, and easier, with other methods. Its only charm is that it uses a coding and modulation method which many amateurs already know (but often do not understand).

Packet (AX25) is an extremely ill suited weak signal protocol. Adding coherent modulation techniques doesn't make this sow's ear into a silk purse. A more robust protocol should be used. We already have Clover II and PACTOR II for that. They're both much better than packet in a weak signal environment. Adding coherent modulation techniques to them would be more fruitful. (Actually, even they would have to be redesigned to take full advantage of coherency. So we really need an all new protocol designed from the ground up to take advantage of externally clocked coherent modulation.)

>below 64k...

No, not at all. TCP/IP was designed to be robust over an unreliable
network. It does that job quite well. At low speeds, performance
is low, of course. That's not a limitation of TCP/IP, rather it is a
limitation of the channel you are using. TCP/IP offers a congestion
control backoff method which does put it at a disadvantage to
other, more hogish, protocols sharing the network. That can be
annoying in a mixed network with limited capacity. But in a pure
TCP/IP network the congestion control strategy works very well
to maximize *everyone's* throughput. It prevents one station from
hogging the network and gives everyone a shot at it.

High channel error rates need to be addressed at the link level.
TCP/IP is a network protocol, not a link level protocol, and requires
one to underlie it. Normally, that's AX25, and AX25 doesn't work
very well on a high error rate channel. The correct solution to that
problem is to add FEC at the physical link level. Dale has done that
in the latest version of the 56 kb RF modem. It makes an enormous
difference in link performance. We could do that at lower speeds
too, but no one has bothered to do it because there's not much
that's interesting that we can do at low speeds.

You're not going to do web browsing on a 1200 baud channel,
and telnet is painful when it takes seconds to echo your characters
back to the screen. But ftp and smtp work fine as non-realtime
processes. At higher speeds, things really come alive of course,
and interactive processes then run just as well as they do on the
wired network. 19.2 kb networks work well, and 56 kb just sings
along. But 9.6 kb is just barely tolerable for interactive processes,
and 1.2 kb is only suitable for non-realtime use. This isn't a matter
of protocol, it is just a matter of how much information your
applications are moving.

Don't confuse the applications with the underlying transport protocol.
That's just fine, but some of the applications typically used with
TCP/IP, such as web browsers, want more information than you
can squeeze through a narrow pipe in a comfortable amount of time.

If you tried to run the same applications over raw AX25, you'd have
the same problem.

The solution is to increase channel capacity so that you can support
the applications, or adopt a limited application set which can work
through the narrow pipe. The latter is what has generally been done
in amateur packet, but it is a dead end approach, and is one of the
major reasons for the declining interest in amateur packet radio. After
experiencing the wired internet, few people find the very limited application
set suitable for use on slow speed wireless networks to be of much
interest. (APRS being the exception.)

But we don't have to remain stuck at low speeds. Here in Georgia, we
were using 56 kb radio links when the wired network was running 9.6 kb
dialups. The wireless network offered us much better performance. Now
that 56 kb dialups are standard, our RF network seems less impressive,
but it is still on a par with the dialups, and allows mobile use.

We can't afford to be complacent, however, because ADSL is coming
quickly. So the next step is to upgrade to a 1.2 Mb RF network. That's
in the works (the Slovenians have already done it). We don't have to take
a back seat to the wired networks. We have more bandwidth than a twisted
pair can ever have. All we have to do is utilize it. Amateur 56 kb has been
a proved technology since 1986, and 1.2 Mb technology has been available
for a couple of years now. The real holdup has been network routers, but
we have a good handle on that now (thanks mainly to the demand for
high speed routers on the wired internet which has driven their cost
down to amateur levels).

In summary, TCP/IP doesn't care what the network speed is, but you
usually do. A low speed network limits the application set you can run
on it very sharply. You can be content with that small application set,
or you can upgrade the physical network to higher speed so that you
can run more interesting applications. The latter seems to me to be
the correct answer. It is the direction we have taken here, and interest
in packet here hasn't suffered the declines seen in other areas. We've
remained competitive with the wired world, and can work seamlessly
with it if we wish, so there has been no wholesale desertion of packet
here by our user base, and it has remained a technical challenge for
our networkers. It's a pity so few other areas have chosen to do the
same. Once we try to reach outside the parts of four states covered
by our network, thoughput drops back into the stone age.

We do. And the real benefit of TCP/IP is in the applications it allows you
to run over the network. There are thousands of applications which work
over a TCP/IP network, but only a tiny handful of applications which will
work over raw AX25. Many of those applications want speed, of course,
so the two things do go hand in glove. The application I like to use most is
white board conferencing, and that's simply not practical at low speed.

(Whenever two or more techies gather, sketching on a napkin immediately
follows, and the only way to do that on packet is by white board conferencing.
And you need speed to make it practical. If we had to wait minutes for a
drawing to transfer, we wouldn't bother to do it. But if we can transfer it
in near realtime, it adds immeasurably to our ability to communicate.)

You hear a lot about these mysterious "applications", but when you look at what is ACTUALLY, NORMALLY done on amateur tcpip, (As opposed to what happens in fantasy-land) you discover a group of bored people having conversations about how unrewarding Ham Radio is.. Once in a while, an FTP transfer is done, whether it needs doing or not. (Yawn)

Recently I switched my node software from 'BPQ to FlexNet, and noticed some IP activity on 145.01 which my old 'BPQ node didn't even display. The FlexNet docs say it moves IP transparently, and that gave me an idea... I'd put an additional Radio/TNC pair on the local TCPIP freq, so those guys would have a handy link to the more popular and capable ROSE net on 145.01.

I hadn't monitored the local TCPIP freq (145.67) in some time. Several years back I ran JNOS and was the local IP coordinator - For all three TCPIP enthusiasts then in the area at that time. I had moved on due to lack of traffic and lack of interest on my part. I'm picky about how long I will tie up equipment with no results.

So I set up a port on 145.67 the other day, and so far I have a record of 48 hours of "dead air".

On the local repeater, I often hear the same three TCPIP ops from several years ago talking about how they need a "gateway". (Amateur Telephone.) They don't talk about "applications", Gary.. They don't talk about High-Speed Packet either. Like the great majority of Amateur TCPIP enthusiasts, they just want a good telephone link.

And that's what is called a "symptom". Amateur Telephone is the disease. Amateur TCPIP is the "carrier", or infecting agent.

Even at "faster" speeds, your network most certainly did not perform as well as the Internet. That's because there's a lot more to performance than speed.

The real holdup is that High-Speed packet is strictly a local phenomena. You can talk across a town with one, or across a county perhaps, but that's about it.

Gary doesn't come out and admit it, but what he is really talking about are a bunch of piddly little High-Speed packet LANS, connected to each other via the Internet. (Amateur Telephone, not Amateur Radio.)

He's not talking about an Amateur Radio network at all. Perhaps this limitation is why Amateur TCPIP enthusiasts are so determined to run down and try to undercut the real Amateur Radio Digital Network. They have discovered that the telephone is not only vital to the existence of Amateur TCPIP, but that it can be used to destroy that embarassing Legitimate, Real digital Ham Radio Network which makes "Amateur Telephone" look so stupid by comparasin.

That one limitation is why amateur TCPIP has no future with Amateur Packet Radio, and why it has such a miserable past. It sucks, as an Amateur Radio protocol. The performance just isn't there, in the real world.

On Gary's napkin, I'm sure it looks a lot more capable. ;-)

I'll stick with the rather impressive application set found in the real Packet Radio network. All of them are quite usable at realistic speeds, even on HF where things slow down seriously.

Am I against High-Speed? No, just against "digital communications hobbyists" who do not see why those pesky Hams keep insisting on using those slow RADIOS, and keep trying to undercut the use of Radio.

I moved on from Amateur TCPIP years ago because it's performance sucked, and hardly anybody was interested in participating in it when you could just twist the dial a bit and have a lot more fun on the ROSE or TexNet frequencies.

It's still that way today. Well, actually in my area it's worse. 49 hours of "dead air", now, and I'm located less than 100 miles from the D/FW metroplex, with LOTS of activity on other packet frequencies... Figure it out for yourself.

If they can't fall back on using the telephone, it's just not worth doing ...

That's why for Hams, TCPIP is just not worth doing.

3108. Out-of-Band TX for Yaesu FT920?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-10 00:00:00 UTC
From: kwick@mitre.org
Message-ID: <kwick-1007981258530001@wickwire7.mitre.org>
Source record: 23277

We bought a '920 to do both ham and company work at our company station
and need to transmit out of band for the latter. (We have SHARES &
other docs to justify this.) To our dismay, Yaesu says they won't/can't tell
us how to do this, even with docs. (Prospective Yaesu-buying MARS
stations beware!)

Anybody know how? A couple of months ago I asked the same question here
and got contradictory answers: a couple of guys said it's done via the menus,
others said we need to load an ASCII file through the CAT RS232 port.
There were also warnings that some 920 versions might do it one way and others
the other; doing it the wrong way could break the radio, etc., etc.

Anybody figured out yet how it's REALLY done?

>The only thing undermining digital packet radio is the negative attitude
you
>dose everyone here with.....

Not at all... I only pick on the Lids and the Geeks.

I have the greatest respect for legitimate Hams, and support them every day.

>I am interested in some factual data supporting your conclusions.

I seriously doubt that. If you had enough interest in the Packet net to have kept up with things, you would not be asking for "proof" of something which any reasonably well-informed packet op has known for years.

>Post it to
>your web page or post it to the newsgroup. I don't want a list of names, I
want
>a list of link pairs that are not radio joined, but wireline joined, and
that
>forward BBS traffic.

Try being clever enough to look at that "list of names" (The LandLine Lid List on my Web page..) and you will have in your hand all the evidence you could possibly need to comprehend the level of damage the Ham Digital Net is suffering from the antics of "Digital Communications Hobbyists". (LandLine Lids)

In the past you have displayed a definite lack of "snap", David, so I'll hold your hand and walk you through it, just this once:

Take the LLL list, and write down the callsigns on a piece of paper.
Now look them up in the callbook, and place city names alongside the callsigns.
Now take a map of the world and put a dot at each LandLine Lid's location.
Now draw lines from each dot to each dot.
Now look at the map, noting the extent of the damage. Each line represents a

route where Amateur Radio was once used, but is now replaced by Amateur TCPIP "LandLine Lid" links over the Internet.
Now understand that the LandLine Lid List is far from complete. One LandLine Lid on packet bragged of over 1500 Internet forwarders, proving of course that Amateur Packet Radio was obsolete. (His contention, not mine.) I'm sure the jerk was lying, but maybe not.

Now look at the state of Texas on your map. Over 1200 miles of high-speed VHF/UHF packet network in Texas is now slated to be shut down and replaced by TCPIP "nodes" which have no radio links to each other at all. - Just Internet links and radio access. TexNet node owners have been informed by the Texas Packet Radio Society that those without good ** INTERNET CONNECTIVITY ** will soon be phased out of the network.

Finally, go back to your "Landline Lid List", and connect to your local packet BBS. Look at ANY message there which has travelled more than a few hundred miles... You are extremely unlikely to find a single such message which has moved the entire distance via Amateur Radio. Most if not all will have gone most of the way via Internet Links. (LandLine Lids.) How can you know? Look at the "R:Lines" on each message, which outline which forwarding stations the message has passed through. Look for calls on the LandLine Lid List. They'll be there.
Just for drill, try counting how many messages which traveled a significant distance WITHOUT going through LandLine Lid links. You probably won't find any, but hey! You might get lucky.

Six years ago, it was common here in Texas to see bulletins from Florida which traveled here via Amateur Packet Radio. (A reasonable thing to expect, wouldn't you say?) That was six years ago, and I have not seen a single message or bulletin from Florida which made it to Texas via Amateur Radio since then. What happened approximately six years ago? KO4KS in Florida and F6CNB in Texas.

>ATCPIP will have no effect on these numbers, ever.

That statement reminds me of my ex-sister-in-law... She is one of those people who must be an "expert" about whatever is being talked about. Though she doesn't know a spark plug from a piston, she is quite capable of standing around while someone works on a car, giving them "expert" advice.

TCPIP is used in every instance of "Internet Forwarding", you dope.

your
>theory that wirelines are damaging the hobby....

Hey I've got an idea that might be better... Why don't you do all that yourself? Remember: You're the one who doesn't comprehend the Packet net. It's your responsibility to correct that deficiency, not mine.

I don't have a "theory" about TCPIP geeks destroying the Packet net. It's an observed fact.

<SNIPPED>

many thanks for the reply, most informative, the problem we face here
in the UK (well, one of them) is the different RF allocations, but I
would be most grateful if you could provide URL's for the hardware you
are using, as it would take us a step nearer to our goal.

FYI here in the UK cable operator have area franchises, with
exclusivity (no competition) and BT has the nationwide telecomms
network, which is supposed not to be a monopoly because they are
supposed to be in competition with the cable telcos.....bullshit.

connecting to an ISP over twisted pair costs, 0.01 pounds per minute
at weekends and 0.07 pounds per minute daytime...

ISDN incurs the same call charges and sets you back anywhere from 300
UKpounds upwards...

leased lines start at around 4000 Ukpounds per annum (64k) and 2
mb/sec will run in excess of 50,000 UKpounds p.a.

so there is a great need for an alternative data transport system...

cheers

I have one computer. I have wanted to experiment with gateways and such at 1200 bps so I can do wireless irc and email. I have one computer. I need TWO computers (I have no friends, hehe). Hmm, I'm not getting anywhere am I. Well, I have a calculator, a TI-92 in fact...

That was then, this is now. I now have my calculator set up with a TNC and a terminal program, it works great for packet (I'm going to make a post in a few hours detailing how I did this, maybe people will stop emailing me, hehe). I have another TNC connected to my computer, yes the Pentium. I also have two radios. I want to try to make a gateway connection to the internet, the only problem is that I can't use my modem on COM2 while I'm using my TNC on COM4 at the same time because they share an IRQ. WOuld it be possible for me to buy an add-on serial port? Where would I get one and for how much $$? Is it likely to conflict with anything? I'm running win95 so hopefully it will manage my resources and prevent conflicts.

Also, how do I go about making a gateway now that I have almost all the essential harware. Maybe someone who has done this before will clue me in.

Oh, one more note: with a connection to the internet on my calculator the possiblities for cheating on tests are endless...just hide the radio and the TNC and the batteries...

I have wondered the same thing about _ALL_ the stuff on the net - ham radio and everything else.

I have concluded that it's only a reflection of what's gone wrong with our society over the past several decades. I'm not a shrink, but I do think it has to do with the fact that no one has any respect for anyone else anymore.

It's socially acceptable nowadays for me to get in your face and tell you "You ain't shit, and you don't know shit. I know it all, and get out of my face."

It's egos run amuck, but nothing good will ever come of this kind of moral deterioration.

My $ .02 - fwiw.

Yes, the content of many E-mail discussions appear to run in the cycles you describe. I noticed it years ago on Fidonet, saw the same thing on Packet, then the same thing again here on the Internet. The Hams are an especially individualistic, opinionated and contentious bunch, and have been for quite some time. This is only true, however, in a general sense. We also appear to have more than our share of whiners, many more than the hobby supported in the past.

>I have concluded that it's only a reflection of what's gone wrong with our
>society over the past several decades. I'm not a shrink, but I do think it
has
>to do with the fact that no one has any respect for anyone else anymore.

You're right, of course. Why would we find persons using telephone links and calling it "Advanced Packet Radio Networking"? Lack of respect for the hobby and their fellow Hams.
Why would large numbers of Hams be willing to stand by and watch that sort of thing happen without doing what they can to correct the situation? Lack of respect for the hobby and themselves.

>It's socially acceptable nowadays for me to get in your face and tell you
"You
>ain't shit, and you don't know shit. I know it all, and get out of my
face."

I've never seen the need to use such language. I guess it's a matter of taste, though... If you think it's socially acceptable, you must run with a rough crowd, OM.

>It's egos run amuck, but nothing good will ever come of this kind of moral
>deterioration.

Well Dave, perhaps if you were interested in the issues being discussed, you'd feel differently. Obviously you are so worried about personalities involved in the discussion that the issues being discussed whizzed right by you. It's amazing how everybody gets something different from a discussion.

Hey! Whatever "floats your boat", I say!

The Land Line Lid list is a politcally oriented list of network nodes that *may* encompass some packet stations that internet forward, but more than likely, given your track record, has alot more nodes that are simply opposed to some idea of yours. I want the link pairs not your politcal list. Put up or shut up, and quit dodging the bullet and referring me to your simple minded politically based LLL list. I want link pairs in the three categories. I think that is the ONLY reasonable way to determine anything. Drawinga map based on your "conclusive list" would be drawing a map of areas that are opposed to your sour attitude toward Hams that don't play along the Charles way. I guess for you to admit that, would invalidate your list, and you wouldn't want to do that, but I surely wouldn't hold it against you. I just want honest answers, not politically polluted answers. And link pairs are the only way to go....

An add-on serial port will most likely have to be set up by jumpers, even in this day of plug and play. Windows 95/98 will not do it for you, unless the serial card is PNP (not many are due to the complexity it would add to such a simple device). For my 3rd port, I added the port as COM3, but set the interrupt to IRQ5 on the card. Windows autodetected it when I hardware scanned. In linux, you have to use the setserial utility to change to non-standard IRQs.

> Also, how do I go about making a gateway now that I have almost all the

Linux or NOS will work, and there are tons of detailed instructions on how to do either out on the internet, probably better than anyone could quickly rewrite here....

It's nice that you have "SHARES & other docs", whatever that means,
but the FT920 does not have Type Acceptance for operation in other radio
services. So Yaesu quite properly will not aid you in breaking the law.

For years, Yaesu has been the outlaw's radio of choice, it is good to
see that they're trying to mend their ways and act responsibly for a
change. Now if only the other manufacturers would take the hint and
do the same, we'd be rid of this plague of illegal outbanding.

I'm not interested in taking the time to take each of your comments apart and refute them, but I will comment on a couple that deserve it.

First, I _purposely_ chose to use the wording I used, for effect. The issue is a serious one, and fluff words weren't sufficient, IMO. The wording I used were to evoke the same emotion from readers that the prevailing "internet attitudes" we were discussing do. I assumed the audience consisted of mature adults who were capable of dealing with mature subject matter, not juveniles. I guess that assumption was not entirely correct.

> >It's egos run amuck, but nothing good will ever come of this kind of moral

>

I must say, that one floored me. I haven't been actively posting here, I just thought I'd comment on the one thread I did post to.

How you are able to discern that I can't stay on topic and have no interest in the "issues being discussed" with so little to go on is way beyond me. You are correct that I "worry about personalities" when said personalities are rude and disrespectful of others. That goes directly to the larger societal problem discussed in the thread.

But the bit about the "issues being discussed whizzing right by me" is quite a leap, Charles. Amazing.

3128. TCPIP over Radio Under WIN95.

Newsgroup: rec.radio.amateur.digital.misc

3129. Icom 706 MK II remote help...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-11 00:00:00 UTC
From: Mitch Hart <KOMFY@ibm.net>
Message-ID: <35A77EF9.A4183601@ibm.net>
Source record: 23113

Has anyone figured out the wiring for remote operation of a Icom 706 MK II (using the optional CT-17 comm interface) from a SCS PTC II controller (HF mode)? This would be extremely handy for automatic setting of operation frequencys. This is used in a Marine Mobile environment, and the laptop computer has only one comm port, so I cannot use the comm option on the CT-17, as it is connected to the PTC II. I would venture a guess that pins "abc" on the 25 pin serial cable connection on the CT-17 are connected to pins "xyz" on the PTC II? The PTC II pins are indicated (ie, an 8 pin mini DIN, with Pin 1=Txd, Pin 6=Icom, etc) in their manual. Unfortunately, the Icom CT-17 pin connections are not indicated, and the PTC folks in Germany are not familiar with this radio(?!). I will be getting a post off to Icom, but I do not expect much response...I have been waiting 2.5 months now for my remote head cable...(and MANY THANKS to HRO in San Diego for the use of their loaner cable..)

The SCS controller indicates that it can be utilized for remote control of the transceiver. The software used (Airmail, by Jim Corenman) indicates that it will also support remote control of the ICOM "direct via PTC II".

All replys appreciated,

Mitch

The limit for 2M is 19,600BAUD(no data rate limits), and I would run my link
at 12,800BAUD(the data rate would be 128,000BPS), so I wouldn'thave a
problem
there.

3131. kamplus tnc gateway

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-11 00:00:00 UTC
From: al7jk@my-dejanews.com
Message-ID: <6o88pl$g1i$1@nnrp1.dejanews.com>
Source record: 23115

Is it possible to use different modes on both HF and VHF
simultaneously while connecting via the gateway callsign
in the kamplus tnc?

example: pactor hf and 1200 baud packet on vhf ....

AL7JK, John Raynsford
Eagle River, Alaska.

hello all,i have a mfj-1270b tnc,i pulled out the eprom for the tnc when
i ran fbb,i can not find it.i'm done running f6fbb with the tnc and now
want to go back as an end users.anybody got an old eprom with the
factory burn laying around you want to part with ?
how about the code ? i can get it burned into a new eprom.
tnx de dave-n2rhl

The complete distribution of paKet 6.1 is at ftp.tapr.org in
/tapr/software_lib/terminal/paket61.zip.

You can get the TAPR 1.1.8a code at ftp.tapr.org in
/tapr/software_lib/tnc/eproms.exe (self-extracting file).

This file also contains the state machine and KISS images.

Some early 1270Bs had only 16K of RAM. If yours is this variety (2 RAM
chips instead of one), you will need to upgrade to 32K for the later
firmware.

TAPR also sells EPROMs with the newer 1.1.9 code which is not available
in image form. See www.tapr.org for details.

If you want/need the mailbox feature, you can buy an EPROM from
MFJ or PacComm.

Cross-posted to: alt.ham-radio.marketplace,rec.radio.amateur.digital.misc,rec.radio.swap

For Sale: New (tested only) Icom IC-F10 HT

IC-F10 SPECIFICATIONS
Frequency Coverage (Rx and Tx):
146-174 MHz (Tested and works at 144+ MHz)
Channel spacing: 25 kHz, 30 kHz (12.5 kHz for narrow type)
Usable Temperature Range: -25°C to +55°C; -22°F to +140°F
Dimensions (with BP-160): 65(W) x 290(H) x 38(D) mm; 2.56(W) x 11.41(H) x 1.5(D) in
(dimensions include length of duckie ant.)
Weight: 365 g; 12.9 oz

TRANSMITTER
Output power (12 V):
High: 4+ W
Low: 1 W
Spurious emissions: -70 dB (0.25 µW)
Frequency stability: ±0.0005%

RECEIVER
Sensitivity (for 12 dB SINAD): 0.35 µV
Adjacent channel selectivity: -70 dB (-60 dB for narrow type)
Spurious rejection: -70 dB
Image rejection: -70 dB
Audio Output Power: 350 mW typical at 10% distortion
Current consumption:
Receive: 70 mA (standby); 300 mA (max. audio)
Transmit: 2.5 A (4 W); 1.0 A (1 W)

Commercial Type Accepted

INCLUDES:

(NEW) BP-160 BATTERY PACK: Voltage: 7.2 V; Capacity: 700 mAh; Output power: 2 W; Charging period: 60 min.(w/BP-79+AD-28) 13 hr.
(NEW) WC BATTERY PACK: Voltage: 12 V; Capacity: 850 mAh; Output power: 4+ W; Charging period: 90 min.(w/BP-79+AD-28) 11 hr.
(NEW) SPEAKER-MICROPHONE: Slim dimensions.
(NEW) PC SOFTWARE easy to use software so you can program your own frequencies into 24 channels.

Includes HT, spare battery, duckie, speaker mic, software, software cable, manual. In original box.

Does not include a battery charger. I use a general purpose charger (MH C777 Universal Charger) Readily available for about $55, new.

Thanks,

AL

3137. Need elmer's help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-11 00:00:00 UTC
From: cyberNOSPAMmoat@webtv.net
Message-ID: <6o8op2$8at$1@nnrp1.dejanews.com>
Source record: 23121

I may be sticking my head on the chopping block by posting here on a webtv, even more so when you read my question. On top of that, I'm not a ham... Radio communications have been my hobby for 30 years.

In the mid '80s I bought a Kantronics UTU 1.2 and a Kantronics Packet Controller 1 (v2.3). I ran these (receive only) on an old Radio Shack TRS Color Computer 2 using a program I bought at a Huntsville, AL hamfest called "Mikeyterm Ver. 4.0. This was a very simple little setup but I could watch a lot of message transfers in several modes and make printouts. All of this equipment still works, however I think it is time to retire the dear old CoCo 2 to my museum of ancient equipment.

About a year ago I was given (for free) a IBM PS/Value Point 325T. It is running Win 3.1 and MS-DOS 6.22. This computer was part of an office network and it has a board with both a BNC male connector and a 15 pin connector out a slot in the back. This board was made by Novell, inc. I have been using this as a word processor and nothing else. I am ashamed to say I know very little about the "operating" of this computer.

Is there a simple way that I can get my KPC and UTU operating on the computer described above. My webtv is my only access to the internet so I can not download a program from the net. I live in a rural area in AL and know no hams and have no computer user friends who could get the program for me.

I would appreciate any help you can give.

Thanks,
Ken

But there is an occupied bandwidth limit of 20 kHz on 2m, and of 100 kHz
on 70cm. You have to design your constellation to stay inside those limits.
That's harder than it may appear if you are also to be able to interoperate
with multiple radios in a TDMA fashion, IE no link by link training sequences.

people flying below the MEA (that uses the pressure altimeter) without looking out the window, probably WILL fly into a mountain. the radar altimeter measures height above ground, the pressure altimeter the height above sea level (same as mountain heights are measured). Need more info: was plane on instruments?, on approach?, departure? while the radar altimeter MAY have been affected, the interaction should have been noted during its use while flying. the pressure altimeter shouldn't have been affected.

In my experience, the civility (for lack of a more precise term) of dicourse varies considerably from forum to forum on the Internet. Of the news groups and mail lists that I read, the ham news groups rank among the worst, although they have a fair amount of company.

I suspected that in some forums the participants actually see each other face-to-face on occasion. I can't imagine saying some of the things that people do here and then showing up at a conference. But, there again, perhaps I simply lack imagination; perhaps some of these people are just as obnoxious in person.

On the other hand, I suppose that my participation in the online world is a bit select: I mostly participate in discussions about the Internet and network research. I mostly got my license (again after 25 years) to tinker with packet. So, it is interesting to see how fixated some people are on AX25, a rather contorted version of X.25, a protocol that I don't think has progressed much in the last fifteen or twenty years. (Sorry, I couldn't resist). I might still get a rig on the air, even on packet, but this does seem like a rather odd bunch these days.

Old style aneroid barometers are pressure based instruments. Newer, and
becoming more common, RADAR altimeters are based on radio emissions and could
conceivably be interfered with by VHF and UHF emissions. Also, many of the
navaids on board an aircraft are very, VERY sensitive to electrical and
magnetic fields (which is why magnetic materials are considered HAZMAT in the
airline industry) and therefore subject to interference from radio signal
emittters.

>conflict with anything?

That shouldn't be necessary. Depending on what serial ports you
have (internal modem? onboard the motherboard?), you should be able
to change the jumpers and/or BIOS settings to put each port on a
different IRQ. If your serial ports are plug-'n'-play, DON'T let
Windows set the IRQ for you-- use the jumpers or whatever to lock
in the settings you want.

Windows 95 won't always recognize how you've set your hardware,
though.. Sometimes you have to manually set IRQ and port address
manually there, too. Open the device manager, expand the "Ports
(COM & LPT)" item, double-click the first serial port you want to
set up to bring up its properties sheet, then select the Resources
tab. Uncheck the "Use automattic settings" box, then click the
"Change settings" button. If Windows won't let you change the
settings, pull down the "Settings based on" menu, and select the
"Basic configuration x" item that will permit you to set the IRQ to
what it is on your hardware. Keep an eye on the "Device conflict
list" to make sure you haven't selected an IRQ that's already in
use (you may have to change IRQ's on some other devices to juggle
things around). When you're done (and you've closed the last serial
port properties sheet), double-click on "Computer" at the top of the
device manager list, and review the list of IRQ assignments to make
sure everything's ok. You should now be set to go.

Which commercial service would that be, that provides Internet
access through a radio link? Other, that is, than cellular
telephone service (which, I think, tends to get a little expensive)?

Hello all;

I am wanting to build a DGPS receiver. The problem is I am not too
hot on the modulation technique used ~ MSK.

Does anyone know of any pointers on the web where i can learn more?

Also, does anyone know where i can find a good, stable design for a
100Hz step, synth controlled reciver for the LF/VLF frequencies?

Your time is much appreciated

Steve H
(Not a HAM, but just loves to 'fiddle' with radios!!)

>
> Yep, that's exactly what I predicted.

Why can't you just provide the list? If the LLL list so utterly definitive and complete, it would have the data I asked for. Yet it does not.

Forget that I even claim it has some political motivations behind it. It does nothing to list links that *are* radio. See, now, you can't see the road from headlights shining into your eyes. Either you choose to dwell in the negative for personal agenda, or your data is incomplete. Should be easy enough to see.....

> >For me to prove your point for you is idiotic.
>
> You've always been comfortable with that in the past...

I haven't proved any point of yours in the past... I may have once or twice agreed with you on *some* things, but I have never taken on the burden of proof for your theories. I have simply asked --- no, begged for *factual* answers to the LLL phenomena you claim exists for the grand total of packet systems.
Can you deliver data to support your claims or can't you? If you like we can even take this to email, to save you any embarrasment in public whatsoever, if it actually bothers you. (I can admit I'm wrong in public, can you?) I just want data, not the "party line" you hand out. For a full set of data, I need both the data that supports your theory (link pairs that make up the LLL list, not just the names/callsigns, a link must exist for a LLL to exist, if you are honest in advertising), and the data that opposes it (existing radio pairs). That would allow the determination whether landline is a trend or localized phenomena constrained to certain areas. Any scientist or researcher understands one must present data to both sides of the arguement before an assumption can be made. Why can't you understand that simple rule of research?

Would it undermine your entire agenda? Care to answer, or will you simply insult my intelligence again? I can wait until I die for facts, as well as wade through your constant barrage of insults to get to those facts.

David

attitudes"
>we were discussing do. I assumed the audience consisted of mature adults
who
>were capable of dealing with mature subject matter, not juveniles. I guess
that
>assumption was not entirely correct.

You assumed a lot there, David. I personally know several Hams who are
juveniles, and by cooincidence they are all involved in Amateur Radio
digital communications. Whether these few I know are "on" this particular
newsgroup or not is a moot point. Others very likely are.

>> >It's egos run amuck, but nothing good will ever come of this kind of
moral

>I must say, that one floored me. I haven't been actively posting here, I
just
>thought I'd comment on the one thread I did post to.

In other words, you had nothing worthwhile (or otherwise) the contribute
to the discussion, so you decided to massage your ego by sitting on the
sidelines, sniping at the actual participants.

Isn't that "special" ? :-D

>How you are able to discern that I can't stay on topic and have no interest
in
>the "issues being discussed" with so little to go on is way beyond me.

I went by the available evidence, and have seen nothing here which indicates
anything different.

>You are
>correct that I "worry about personalities" when said personalities are rude
and
>disrespectful of others. That goes directly to the larger societal problem
>discussed in the thread.

But it's "OK" when YOU do it in the "cause", huh? Kind of like copulating
in promotion of virginity.

Guys like you are a million laughs. You'd make a great televangelist. Cash
in on your vocation, David!

>But the bit about the "issues being discussed whizzing right by me" is
quite a
>leap, Charles. Amazing.

No, actually it's fairly typical of most whiners and hypocrites I've run
across. Why should I expect you to be any different?

I let the evidence speak for itself, and so far you have only showed that
you like to whine. You're even capable of including the very thing you whine
about as PART of your whine... Now, THAT'S talent !

Again, I would like to suggest that you develop your talent, and channel it
into activities where whining hypocracy is a big plus, instead of a minus.

Have you considered going into politics?

That's because you are not sincere in wanting to know the truth of the
matter. You just want to debate.

That's why you have refused to look at what was offered, or bothered to
verify it for yourself.

I guess you are too stupid to realize that if you do not believe one bit of
info I offer you, there is no reason to believe that any further info would
be accepted either. To demand MORE info when you are too cowardly to look at
what's already been offered is a waste of everyone's time. - Most
importantly, it's a waste of my time.

Everything I gave you, icluding the "LandLine Lid List" can be verified by
any competent Packet op... Is that the problem you are having, David? Too
incompetent as a Ham to do it? Remember that since you refuse to "believe"
the information I offered and have been given a mechanism for verifying it
for yourself, the ball is now most definitely in YOUR court.

My guess is that you will whine and stick your head a little futher in the
sand instead...

>Forget that I even claim it has some political motivations behind it. It
does
>nothing to list links that *are* radio.

Nobody has a list of all packet links in existence, and you know it.

Impossible demands are often made by losers of a debate, in a last-ditch
effort to divert attention away from that fact. You lose, David.

>See, now, you can't see the road from

I agree - there certainly seems to be that possibility. They seem to look for ways to employ the "attitude" thing and thrive on it. Then, if *anyone* dares to call them to task for it, that individual becomes a "whiner". Won't you join me? <G>

Well, when data transfer speeds in the real world are as fast as they are, and getting faster all the time, I have always, and continue to regard packet as only a curiosity. Seems at least some of the packet purveyors here *are* as you describe, as well.

From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6oa857$a54@enews4.newsguy.com>
Source record: 23188

Just in case David Pierce forgot, here are the LandLine Lid List, along with the simple tasks I offered for him, which allow him (or anyone else) to comprehend the extent of the damage Amateur TCPIP operators have done to the global Amateur Radio Digital Net with the imposition of Non-Amateur communications throughout the network. (Internet Forwarding of Amateur Packet Radio messages and bulletins.)

I doubt that he has actually lost track of this info, but David is a real "excuse maker", and we wouldn't want him to been seen as a weasel, now would we? I'm sure David appreciates this additional opportunity to display his character.

Everything below is easily verifiable by any reasonably competent packet op, especially if they are not "too smart to learn", and so are able to ask for help when and if they need it. I suspect this is the real reason David has found one excuse after another for not verifying what he claims not to believe...

The LandLine Lid List

(Regularly updated from N7QDN's list, as seen on the Packet Radio network.)

Stations forwarding Amateur Radio bulletin traffic via the Internet. Radio Operators who avoid these stations will help rebuild our radio network.

US Callsigns:

AE1T KB1BWD N1UAN KE2VW N2MEG NY2S
KA3FMO K3JZ KE4HSB KO4KS KP4IG N4GAA
N4LXI N4WFU KB5VJY NX5V N5VDA WB5THT
KA6EYH KB7FRV KI7AA N7FSP N7VMR W7TA
WB7AWL KB8UVN WB8BII WB8NWQ N8KHN
KF9UG N9DBX KA0WIN KE0WO N0ROD WB0TAX
KD4YAL K4VJI WD4NKZ W1NPR WA2LKI N7NEI
W8YY KO6RI KB0TDF W4DPH KA9DSA N8YIB
W3SYY WD0AJG WB7TLS N5VGC K4VJI N8KJT
KF6QDP KC6HUB KB0KQH KD4HTU N7VPB

Non-US Callsigns:

F6CNB GB7GUR GB7HSN GB7PLY HA3PG
HR2PAQ ON6AR PY1AA PY1LCZ PP5BLU
RK3DXA SK2DR SV2CMG VE4UA VE7KIT

VE7VBS VK3BBS VK7AX XE2EBC VE6LIP
VE7RXD VK2CZR VK2GJB VK2TGB VK4ATV
VK5ASF VK5XXX ZL2TZE PE0MAR VK7NT
VK2SRN VK2KAW VK6BBS VK6ZSE VK6BBR
VK2WI VK7GL VK1DSN VK5SR VE3IJD

Take the LLL list, and write down the callsigns on a piece of paper.
Now look them up in the callbook, and place city names alongside the callsigns.
Now take a map of the world and put a dot at each LandLine Lid's location.
Now draw lines from each dot to each dot.
Now look at the map, noting the extent of the damage. Each line represents a route where Amateur Radio was once used, but is now replaced by Amateur TCPIP "LandLine Lid" links over the Internet.
Now understand that the LandLine Lid List is far from complete. One LandLine Lid on packet bragged of over 1500 Internet forwarders, proving of course that Amateur Packet Radio was obsolete. (His contention, not mine.) I'm sure the jerk was lying, but maybe not.

Now look at the state of Texas on your map. Over 1200 miles of high-speed VHF/UHF packet network in Texas is now slated to be shut down and replaced by TCPIP "nodes" which have no radio links to each other at all. - Just Internet links and radio access. TexNet node owners have been informed by the Texas Packet Radio Society that those without good ** INTERNET CONNECTIVITY ** will soon be phased out of the "network".

Finally, go back to your "Landline Lid List", and connect to your local packet BBS. Look at ANY message there which has travelled more than a few hundred miles... You are extremely unlikely to find a single such message which has moved the entire distance via Amateur Radio. Most if not all will have gone most of the way via Internet Links. (LandLine Lids.) How can you know? Look at the "R:Lines" on each message, which outline which forwarding stations the message has passed through. (Link pairs) Look for calls on the
LandLine Lid List. They'll be there, in pairs.
Just for drill, try counting how many messages traveled a significant distance
WITHOUT going through LandLine Lid links. You probably won't find any, but hey! You might get lucky.

Tell you what: I'll challenge you to send me a packet message which does NOT go through an Internet Forwarder along the way. I say you can't do it, and that right there is all the "facts" you need to understand that Internet Forwarding has significantly affected the integrity of the Amateur Radio Digital RF Network.

The RF modem we use was designed by Dale Heatherington, WA4DSY.
Visit his website, www.wa4dsy.radio.org, for details on the modem. We
originally produced it as a kit, but now it is available as a wired and tested
product from PacComm, www.paccomm.com. We use an assortment of
transverters to take the 29 MHz output of the RF modem up to a VHF or
UHF band. We use the Microwave Modules MMT432S in a number of our
stations, but that's out of production now. We also use Down East Microwave
transverters, SSB Electronics transverters, and one of us even uses a
Hamtronics transverter (I don't recomend this one, but he has gotten it
to work). On the computer side, we use the Ottawa PI-2 card or the
Gracilis card as the digital data pump since a PC normally can't handle
HDLC data directly (though a Mac can).

>
>so there is a great need for an alternative data transport system...

Well, do remember that this is amateur radio. We aren't allowed to
provide alternate common carrier services. The WA4DSY RF modem
has been used in commercial and government service, but it was
primarily designed to serve the amateur radio digital community.

Its not an impossible demand to list the link pairs in the US. Let's see,
I have book around here right now written about packet that has a complete map
for some region in the US. Let me refernece you to page 11-8 of the book, Your
Gateway to Packet Radio, Stan Horzepa, WA1LOU, page 11-8. These maps are far

from impossible, and a link list can be derived or perhaps wireline links can be painted a different color in such a map, even on a nationwide scale (the one in question was for VA).

Now who is losing, Charles? I've got confirmable evidence (thought that network has probably evolved some sinc the publication of that book), you still haven't confirmed anything for me. Now, please put some data out.

The twisted webs Charles *attempt* to weave,

David

Your LLL list is not sufficient to derive any meaning whatsoever as to the state of packet. I gave you a reference that should prove my point entirely that the data I want is available, may I refer you to our other thread. Please post the data or quit barraging the groups and posters here with your ill concieved agenda.

My reference should speak volumes of my character. I haven't gotten any real references from you. I back up what I say with different sources than my own agenda. Your data is derived from your own needs to prove a point, from your own observations.

The very nature of the network says it will be possible for those links to be found and utilized, fastest there first wins of course. However, my point is, that if those links went away the message would *still* get there. Since you have placed the theory here in this forum that these wireline links have destroyed the radio side of the network, would imply the message would not get there. You have given no data to prove or refute *your* claims.

And of course there is always the TEKK radios, cheap and no mods
required. I run the KS-1000 and the KS-900 without any dificulty. Good
luck.

3160. Tekk 19,200 radio-modems and DCD

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-12 00:00:00 UTC
From: David L Pearce <dlpearce@eos.ncsu.edu>
Message-ID: <35A8ECEE.4DE9E477@eos.ncsu.edu>
Source record: 23194

These radios have a data slicer built in, but do these radio's have DCD detection built in, or must the datacontroller sort that out? Also, is there somewhere on the net with more technical data than the Paccomm site?

Thanks,

David - KF4MOK

Oops, I confused the Tekk and Kantronics radios. I don't think the Tekk has neither a slicer or DCD detection circuit... or does it? Where can one purchase a 19200 modem w/DCD, ready to be connected to the dataradio and the host node computer? The node computer I plan to construct myself....

3164. Redhat support for ham software

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-12 00:00:00 UTC
From: arm@helix.nih.gov
Message-ID: <6oavei$mpq1@icet.net.nih.gov>
Source record: 23198
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space,rec.radio.amateur.dx,rec.radio.amateur.antenna

Redhat, the largest distributor of Linux (free unix for the PC), has hired an active ham to move ham radio software into the mainstream of the Linux platform. Jeff Johnson, N3NPQ, has asked the ham radio community to identify and test ham software for Linux. If you have email, you can help decide what ham-oriented software will become available on the Redhat distribution.

Jeff is compiling a list of the software that hams want included. This can be public domain or commercial softare. This can include software that already runs on Linux, or software that would need to be ported to Linux.

Jeff is also compiling a list of people who are running Linux and are willing to test some of the ham software. Please let him know what packages you would like to test.

Here is how to contribute:

Send an email to:
jbj@redhat.com

Begin the subject line with Jeff's call:
N3NPQ - <meaningful subject here>

Please don't do a "reply" to this email. The reply will come to me, which won't do any of us much good.

Note, if you want to see an example if what Linux can do, check out the Internet Web Radio Receiver in last February's QST, or try it on line at:
nihac.info.nih.gov/listener/listener.html

Dear All,

I have a question. Having just received a 6790/GM from the US I am going through full alignment. In the RA1792 manual (very much the UK version of the 6790) It gives full alignment details but on the A2 board some bandpass filtering is different.

I need to know what bandstop frequencies filters L1, L2, L3 and, L4 should be tuned at on the A2 1st mixer board on the 6790/GM? This is not in the 6790 manual as it is only designed to be used to boardswap level unlike the RA1792 manual in the UK. On the RA1792 there are only two filters at this point which and they should be bandstop tuned at 17.6Mhz for L3 and 26.045Mhz for L4.

Any help very much appreciated. I guess this information would be in some board level (module) alignment manuals. The tuneable inductances are not given values in the parts lists either so I cannot even calculate the theoretical resonance point.

PS Please e-mail direct as well as posting to the news group as news expires very quickly on m y news server.

regards

Mike Gibson

Then use my list, or Duane's list, or any of the other lists, or make your
own list (it is easy to do, you can snag the software to do it off my web page).

Then draw the map of HAM RADIO links. That is a lot easier, since there
are very very few of them left.

Are you ON packet radio? If so, you can make the observation yourself,
download the bulletins addressed to LLL yourself and read them, and
you could ask your local sysop for the past ten years of his log files and
analyze them yourself. The software to do this is on my web page. If you
want me to be a "radio purist" I'll be glad to 7plus it to you via radio.

Charles has actually understated the problem. There is no longer ANY
significant long haul radio network left in operation. It's gone. Destroyed
by the Land Line Lids.

Go read the bulletins. Once you have done a bit of investigation on your
own then you might have some standing to enter this discussion. If your
local BBS does not archive bulletins, you can always visit deja news and
snag them all from there.

> dependent on radio.

Pretty simple.

All of the bulletins which arrive here from outside a 100 mile radius come through the internet with the exception of a very few which arrive directly at my system via 40M CLOVER from California. Most personal messages can (and sometimes do) arrive here via CLOVER/PACTOR/AMTOR and (very occasionally) HF packet. Most NTS traffic traverses one or more internet links before it arrives here.

The problem is not to identify the Land Line Lid links, but rather to find an actual RADIO link somewhere in the headers. Bet you cannot find any.

But heck, give it a try ... <smile>

The above URL was posted in error. While it's a fine site, it has nothing
to do with radio data signals. The one I meant to post was:

http://www.geocities.com/SiliconValley/Lab/1067/PROJECTS.HTM

I wouldn't have bothered to re-post, except that the correct site is one
of the best resources for such information.

also:
> http://fly.to/airnav/
Isn't what I was thought, either. I thought it was an ACARS site. Try:

http://www.tardis.ed.ac.uk/~kr

Hope I got it all straight this time!

Some apps only run under windoze, but you don't have to run the TNCs
off of the windoze machine. A Linux machine on your LAN can serve
as the outside gateway. I have an antique 486 66 MHz machine which
does that for me. It just sits over in the corner handling the phone and
radio connections for my home LAN.

Right. The Kantronics radios (no longer in production) had a built in data
slicer and DCD. The TEKKs do not. I don't know of any commercially
available 19.2 kb modems designed to connect to radios. However, you
could use the data slicer circuit from the WA4DSY modem. It is a tracking
design, so if the radios drift a bit it still works well.

That's not true, WSS compatible chipsets (such as AD184x, CS423x)
work at least as good if not better.

8bit soundblasters and emulations however limit the available modes
as their sampling rate is very limited.

Yes and no. The hardware will support this operation, but there is
currently no software to do it. I have been playing around with doing this
very thing. Depending on how much time I have, I might have something this
winter.

I've fought this battle before on the newsgroups. Unfortunately, while I have the greatest imaginable respect for aviators, I have to say that I've found them a rather superstitious lot, and when it comes to the RFI question, it's very hard to sell them on the logical dictum that correlation does not imply causality. Maybe it has something to do with the fact that many of them are charged with the fate of hundreds of lives on a daily basis. I dunno. :-)

Inevitably, to me, the question is very simple. If some disobedient kid with a Game Boy in row 17 actually CAN bring down the 737 I'm flying on, then as far as I'm concerned the fault rests solely with the FAA and the avionics industry, and not the kid's. (Small comfort, obviously.) With the communications technology available today, there is simply no excuse for consumer-device RFI to be an issue worthy of discussion.

Ken,
The answer is very simple. Both the UTU and your KPC will communicate very happily with the Windows 3.1 "Terminal" program. This comes standard with Windows 3.1 (and it also works with Windows 95). It isn't very difficult to set up.

I use Terminal with my UTU and a KPC-2 without any problems, both receive and transmit. If you have trouble getting it going, email me at as149@detroit.freenet.org and I'll send you my setup file.

Murray ZL1BPU.

>networking.
>In other words, Amateur TCPIP appears to be a major damper on large-scale RF
>(Ham) networking.

Tell me Charles, are the hams who use pacsats or store & forward
not acting as true hams? I also note that even the ARRL when it
encourages hams to pass on radiograms (when's the last time you
got a telegram, or Western Union made a lot of money sending
telegrams?) states that hams getting the traffic should get a working
and recent phone number so that the radiogram can finally be delivered.
Technology moves on. Hams don't become hams just so they can
meet people around the world anymore, and the packet network
probably wouldn't really exist if some hams didn't use landlines to
forward some of the packet traffic. There are lots of places without
real connectivity, and HF using Pactor, Clover, Gtor, or Pactor II
may not work either, or said ham involved may not have HF
privileges. A lot of the hams still on packet seem to be techs, and
most also have some access to the internet. Even you find yourself
on here more than on regular packet, or at least you post on here
more.

I also don't think a 500 baud HF connection that has to service let's
say 50 hams is going to pass on all of the packet traffic even if
the amount of traffic is down, and the number posting is also down.
Landline lids or not, the network as you put it, is slowly fading away
as people get tired of 1200 baud connects and 100 baud throughput
in the real world. It may not be what you want, but ham radio will
survive whether packet does or not. After all in 1980, how many
hams were on packet?

thanx for the information...we looked up the philips TDA8040 and the 8041...it's just what we need but including this chipset will put us way over our project budget. So we may not use this...and since it is not terribly important for us to have high data rates, we may instead change to a FSK system.

By the way, we are final year students at the University of Auckland. We're designing a wireless communications system for a robotic insect which has already been built. The range we are looking at is about 30-40 metres. This bug currently uses an RS232 interface to communicate with a microcomputer to obtain instructions.

Any tips regarding a quadrature FSK system would help heaps.

Tried emailling but mail was returned with an error message.

Thanks.

rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc,rec.radio.shortwave,uk.radio.amateur

I have a question. Having just received a 6790/GM from the US I am going through full alignment. In the RA1792 manual (very much the UK version of the 6790) It gives full alignment details but on the A2 board some bandpass filtering is different.

I need to know what bandstop frequencies filters L1, L2, L3 and, L4 should be tuned at on the A2 1st mixer board on the 6790/GM? This is not in the 6790 manual as it is only designed to be used to boardswap level unlike the RA1792 manual in the UK. On the RA1792 there are only two filters at this point which and they should be bandstop tuned at 17.6Mhz for L3 and 26.045Mhz for L4.

Any help very much appreciated. I guess this information would be in some board level (module) alignment manuals. The tuneable inductances are not given values in the parts lists either so I cannot even calculate the theoretical resonance point.

PS Please e-mail direct as well as posting to the news group as news expires very quickly on m y news server.

regards

Mike Gibson

Could some one email me audio files with GMDSS/DSC samples?
I am the author of RadioRaft, a multi-mode radio data decoder software
working with the Hamcomm interface.
For the next release, I would like add the decoding of Digital Selective
Calling used in the maritime mobile service.

International DSC frequencies are:
VHF Ch.70 (156.525 Mhz)
MF 2187.5 KHZ
HF4 4207.5 kHz
HF6 6312.0 KHZ
HF8 8414.5 KHZ
HF12 12577.0 KHZ
HF16 16804.0 KHZ

Audio files .wav, 8bits, 11Khz sample rate, are enough.
Tks in advance.
Francois Guillet F6FLT@TheOffice.net

From: RR Kerr <robert.kerr@gtri.gatech.edu>
Message-ID: <35ABAF30.C739FF63@gtri.gatech.edu>
Source record: 23228

I'm looking for two or more packet radio operators to help at the Head of the Chatthoochee rowing regatta at the 1996 Olympic Rowing Venue near Gainesville, GA on Saturday, November 7, 1998. The Head of the Chattahoochee is presented by the Atlanta Rowing Club and the United States Rowing Association.

This is a race for time over a three mile course, involving several hundred boats, starting in sequence. The packet application would involve sending spreadsheet start time data from the start line to the finish line for each of the several separate events during the day. The start line is in a remote location along the river where no landline or cellular telephone service is available. We plan to place a houseboat on the start line for an equipment /operator shelter.

Atlanta Rowing Club will provide free food, T-shirts, and accommodations to volunteers.

Check the Atlanta Rowing Club web page for info:
http://www.mindspring.com/~atlantarow

If interested, please respond to:

I hate to argue, but what FCC rule prohibits this specifically ?

Let's say I took a commercial rig and recrystalled it for some ham
fequency. Then at a later date I decided to restore it to original
condition.
Now it's illegal ? why ?

I do remember that a Second Class License was required (Now that
damned general radiotelephone license) to do the transmitter
adjustments, but this is no longer so.

Gustavo Flores WB2URK, First Class, radar endorsement and all that
good stuff.

Here, here.

Now a little anecdote.

My best friend, who flies for American Eagle was commuting home in a jetliner jumpseat.
The controllers cleared the flight direct to a VOR some 200 miles away. Charts go flying in the cockpit, they can't find it right away. Finally they get the frequency right but still the flag is out and there is no reliable reception. The captain now summons the flight atendant and asks to check if someone back there is using a laptop computer and if so to turn it off. By then the flag disappears and reliable indications resume. Of course during all this exchange they had travelled some 80 miles closer to the station, but still the captain threw up his hands and said "see portable electronic equipment nterference "

The standard service range for an H class VORTAC is 130 nautical miles at altitudes between 18000' and 45000'
But never mind that, this is another "proof" of interference to radio aids to navigation.

Gustavo Flores WB2URK, also a pilot.

3199. TS870 Filter Mod needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-15 00:00:00 UTC
From: Joe Caluda <jc05@gnofn.org>
Message-ID: <35AC467E.5F0@gnofn.org>
Source record: 23133

I spoke with someone from International Radio who told me that a few hams have done some filter Mods to the TS870.
They changed out the 3 Kz filter for International's 2.1 Khz filter.
International however had no details on this mod.
Does anyone know about this mod or another that will add a crystal filter, say 500hz, at the 455 IF level??
Adding a crystal filter would really enhance the aready fine digital filtering in this radio.
Any comments or info is appreciated.

Well there does not seem to be a rule for not using a hand held or transmitting equipment in a balloon here. The BR 68 does not mention it. I would say you could use the ham gear for transmitting in a balloon.

> The reason why ? Maybe to limit the radio coverage of a potential high altitude
> transmitter... the text doesn't give any reason why.
>

Possible! A friend of mine who had to do some work in the Canada Tower, Canary Wharf, took a hand held up there and was talking to someone in Margate on 250mw. Nobody seem to pull him over about it. The Canada tower is very high.

> A friend from the radio club was asking whether or not a short wave *long* wire

> 73 de f5hnk/Patrick

Well seeing as you could, well it seems you could transmit in a balloon this would seem to be possible without breaking the law.

I'm sorry, but I don't see any point to that question. The AMSAT people,
after all, do use Ham Radio to communicate with those birds, which operate
on Ham freqs as well.

I guess the question must have sounded good to you for some reason, even
though it had no relevance to the discussion. (LandLine Lids)

>I also note that even the ARRL when it
>encourages hams to pass on radiograms (when's the last time you
>got a telegram, or Western Union made a lot of money sending
>telegrams?) states that hams getting the traffic should get a working
>and recent phone number so that the radiogram can finally be delivered.

Again, the relevance to the problem with Internet forwarding just isn't
there. In delivering NTS traffiic, the last few miles the message travels is
, yes, by telephone. In this case, the telephone is used for the simple
reason that the messages GO to NON-HAMS. - Duh!

In Internet Forwarding, the telephone is used to move the message the
majority of the distance it travels, even though the message is FROM a HAM,
TO a HAM.

I've heard the "NTS is the same as Internet Forwarding" arguement on several
occasions. In each instance, I have seriously doubted the intelligence of
the person who asked that rather ignorant question. This is certainly no
exception.

>Technology moves on. Hams don't become hams just so they can
>meet people around the world anymore, and the packet network
>probably wouldn't really exist if some hams didn't use landlines to

>forward some of the packet traffic.

Well, you did it, Art... You managed to top the stupidity of your "NTS is the same as InterNet Forwarding" question.

The packet network "really existed" prior to the LandLine Lid infection.

Moron.

>There are lots of places without
>real connectivity, and HF using Pactor, Clover, Gtor, or Pactor II
>may not work either, or said ham involved may not have HF
>privileges.

Yep, that's right. I suppose the idea that not all Hams have the same privileges "bothers" you too, huh Art? Is the liscense structure of Ham Radio the next thing on the LandLine Lid "hit list", now that the packet network has been raped?

Knowing the lack of character as displayed by LandLine Lids I know, I'd say that ANY sort of anti-ham activity is possible. -- And you, Art, appear to want to be a "part" of that process.

I hope you fry in hell, OM. Fry in hell. Real soon.

>A lot of the hams still on packet seem to be techs, and
>most also have some access to the internet. Even you find yourself
>on here more than on regular packet, or at least you post on here
>more.

So? What's it to you? Does it bother you that my web page was written up in QST, that I administrate a couple of reflectors, and yet I still can differentiate between the Internet and Packet Radio?
All I've done is prove that you don't have to be a geek to do the Internet thing. Big deal.

>I also don't think a 500 baud HF connection that has to service let's
>say 50 hams is going to pass on all of the packet traffic even if
>the amount of traffic is down, and the number posting is also down.

Well, Art, you have to understand that as an advocate of "Internet Forwarding", your opinion as a Ham means nothing.

You are either FOR Amateur Radio, or AGAINST it. Since you are AGAINST Ham Radio, you're opinion means absolutely nothing within a discussion of the same.

>Landline lids or not, the network as you put it, is slowly fading away
>as people get tired of 1200 baud connects and 100 baud throughput
>in the real world.

Actually, it's going strong, but only in those places where "gateways" and "Internet Forwarding" are illegal and those laws are vigorously enforced. The only documented places where the Packet net is folding up are those places such as the US, where LandLine Lids have been allowed to run amok.

You, Art, are part of what is sucking Amateur Packet Radio in the US down. Being part of that, Art, you suck as well. Really hard.

If you had any manhood or decency about you, you would mail your ticket back to the FCC today. But you don't. Your type is happiest when they can hang around and be a drag on whatever it is they "participate" in.

Spam.

Charlie Boy, run in the bathroom and check the reflector over the sink.
You'll see the world's Number One Fanatical Packet Idiot.

There never WAS a 'global packet network'. Nobody destroyed it. It
never existed. The packet 'network' in the U.S. never could get a
message from the east coast to the west coast in less than a month
without sending it thru Europe 3 or 4 times. Negative technology,
Charlie Boy. Total waste of electricity.

It's not 1972 any more, Charlie. Nobody is impressed with you forwarding
@WW packet bulletins with 99 lines of headers and no message text at
the blazing speed of 1200 baud on your VHF radio.

Everything you have to say, you have already said, about 2,000 times.
Nobody is interested. Nobody cares. Take your FBB BBS and hit the bricks.
Go play in traffic. Get your MFJ TNC gold plated and hang it on the
mirror in your pickup truck. Get a life. Borrow or rent a clue.

You sound like an @WW bulletin stuck in a loop. Which was about the
only thing your 'global packet network' ever was good for. Do something
constructive for a change, like go buy some eggs and raise chickens.

Hi
in America it is up to the pilot/ship captain as to
which radios are used. So with the pilots permission
ham radio would be legal.

That is pure, unadulterated B.S. I ran a BBS for several years, and I
forwarded thousands of messages that came from the East coast without
going through Europe. From here in Idaho, they went on to the West
Coast via a VHF network. Those links are gone now. When you don't
know what you are talking about, it's a good idea to keep quiet.

Nobody is impressed by hams using the Internet to send ham _radio_
traffic, either. It takes almost NO effort or initiative to use
commercial services rather than do what it takes to set up an amateur
radio network, no matter what the actual speed is.

I hope this is the right group. Anyways, I installed last night FlexNet(I have to say it's be the EASIEST setup for packet I've seen) and I haven't seen anything about using it for HF packet or anything for 300buad. I assume it's still being used on HF, just trying to get into it. Or should I try to get into another digital mode?

I would have had to have seen your BBS in action to see if you ran it or you
turned it on and watched TV. And why did you STOP running a BBS ?
More fun to argue in near real time on Usenet ?

I ran a BBS for five years too, Glen. And even when we delivered mail
to the U.S. via satellite, most of it went one place - the bit bucket. The
U.S. packet network never was reliable for anything but across town for one
reason - too many people 'running BBS's' in the autopilot mode. Turn on
the software, pat yourself on the back, add 'SYSOP' to your resume,
and go watch TV. Any bubblehead that downloaded a copy of FBB was
an overnite 'sysop'.

Any network is only as good as it's weakest link, and the amateur radio
packet network never was composed of anything BUT weak links. The
imaginary 'global packet network' the Charlie keeps babbling about was
detined to fail by designed l - if 100 people routed and forwarded mail
correctly, all it took was one more system not set up correctly to dump it in
the bit bucket and defeat what the other 100 had done correctly.

In 1992 I wasted the effort of dragging a notebook computer, a radio,
and a TNC on a trip to the states with me. I put a bunch of packet
mail on one of the main BBS's in the Washington, D.C. area. Two
weeks later when I left, it was still sitting there, not forwarded anywhere.
I went nowhere in the U.S. on a six week trip where I could send a
packet message and recieve an answer.

One time I asked a guy who was patting himself on the back over
reaching message number 100,000 on his BBS 'How many of the
100,000 messages that you have forwarded do you thing reached
thier destination ?' His answer was 'If 50%, I'm happy'. That's
why the packet network never was....

Forwarding bulletins is not magic - you can forward them anywhere,
you don't have to figure out routing. Forwarding mail that has to go
to a specific place is another story, and one that ham radio never
could figure out how to tell.

>I don't see where your brand of vitriol is any more constructive than
>Brabham's.

In Charlie Boy's case, it's not intended to be. There are still plenty of uses for packet radio. APRS, PacketCluster, etc. - maybe some new ones to come.

What Charlie Boy fails to comprehend, is that the amateur packet radio network is useless be it radio links, telephone links, whatever. Anyone forwarding packet bulletins irregardless of how they forward them is doing it for one reason - it's something to do, more toys to play with. Networks are designed to diseminate information. What information can you distribute on packet radio that you can't distribute via other means ? This is 1998. Not 1972.

Charlie Boy wants to be a 'sysop'. And we don't need 'sysops' any more. Nobody in thier right mind would think about using packet radio as opposed to email. That's why we are discussing this HERE instead of on the 'global packet network'.

Source record: 23145

Hi!

My dad is going cruising around the coast of the US (FL, east coast) and the bahamas on a boat he will live on. I'd like to keep in touch with him via the net and APRS using one of the Java gateways that ware available.

He has a ham license and I will get one if I need to. What would be the best usable setup for him to be able to get on the net and retrieve and send me e-mail and to have his boat report position information.

He has a GPS Magellin 3000XL and a Pentium 100 laptop with SVGA and a serial port. I assume for APRS he will need some type of TNC and radio, but what about TCP/IP. I know about the 56K network here in Atlanta, is that availabe in most places?

Is there a digial radio mail protocol that can get messages to/from the internet rather seamlessly? Do I need to set up a ham digital ground BBS to get messages from him?

Thanks for any help!

- Shawn

In article <6ohsuc$dsk@enews4.newsguy.com>, "Charles Brabham"
<n5pvl@texoma.net> writes:

>I'm sorry, but I don't see any point to that question. The AMSAT people,
>after all, do use Ham Radio to communicate with those birds, which operate
>on Ham freqs as well.

Yet the cost to put up each amateur satellite is considerably more
than amateurs can afford. Further, what's the difference between
using a satellite on amateur frequencies, and using a connection
to the internet? You're making a distinction without meaning here
whether or not you recognize it. If the internet traffic passes through
a satellite, it's using approximately the same technology as the
amateur one is. Amateurs also can't fix satellites once something
goes wrong or the batteries go down, or the software goes crazy
or the receiver goes deaf or whatever. The PacSats are fun to play
with, but hams alone can't put them up in orbit either.

>I guess the question must have sounded good to you for some reason, even
>though it had no relevance to the discussion. (LandLine Lids)

Charles, eventually, you're going to have to realize that every amateur
contact requires more than hams alone provide whether one is
discussing CW or packet, pactor, Gtor or whatever.
> >I also note that even the ARRL when it

No, it's not a DUH. The phone is still used, usually even if as is
common now for much of the NTS traffic, the final recipient is a
ham. Why, because the phone works better in that role than
trying to find out which frequencies a ham is likely to monitor
if he's on at all, and at what time he's available. You may not like it,
but radiogram traffic is down too, even that forwarded by some
digital mode besides CW.

Tell me something, since your IQ is so high and mighty, why must you
make a personal attack rather than responding to the points raised?
You also don't bother rebutting the concept, the NTS is dependent on
the phone for most of the deliveries it makes, whether it's for the last
one thousandth of a mile or 24,000 miles, just how is that so different
from using phone circuitry, or even satellites to deliver traffic then dumping
it out to another ham?

>>Technology moves on. Hams don't become hams just so they can

>Moron.

Once again, Charles, as someone who has been around Packet radio
since the TNC1, and actually used one of the old Bell 202 modems,
why should I believe your statement? Packet traffic is down, packet
BBS setups are down in real numbers and in connects handled. While
the SEDAN network in the Southeast does allow keyboard to keyboard
connects, it doesn't have the infrastructure to pass all of the traffic
necessary even at the reduced levels now. It wasn't landline lids
unless of course, you're referring to all of the hams who used to
get on packet, who now get on email lists and usenet. If that's
whom you mean, then you have to include yourself don't you?

>>There are lots of places without

Charles, I've been able to get legally on HF for quite a while. I can use
all of the HF digital bands legally, that's got nothing to do with my
comment that many hams on packet can't legally get on HF, but
have to find someone to forward their traffic for them. Why not deal
with the issue rather than attacking me. BTW, I passed my cw
test in front of the FCC, so I didn't get a medical waiver either.

>I hope you fry in hell, OM. Fry in hell. Real soon.

Why Charles? Why? Because I'm rational enough to realize that
like relying on a mule for transport, instead of a car,packet at 1200 baud,
or 50 baud effective throughput or less is less efficient than using phones
where connectivity exists. That whether I use a simulated modem,
that's what VHF packet emulates, a 1200 baud Bell 202 phone modem,
on the radio, or a modem on a phone line, or an ISDN connection, or
even a 2400 baud connection via radio to someone connected to the
internet, I'm still communicating with other hams, rather than berating
them for using what works best.

>>A lot of the hams still on packet seem to be techs, and

First, my opinion counts at least as much as yours does. In fact, I'm
willing to bet that I'm on the air more than you, using amateur
frequencies to communicate with other hams. I'm not picking on you,
merely noting that you want things to stand still. I still remember
when some hams tried to jam packet signals at 145.01 because
that frequency had other uses. They sounded much like you sound
now railing against internet forwarding. They lost, but they could
possibly reclaim 145.01 in some places for all the activity on there,
because most hams don't find 1200 baud or even 9k6 baud
particularly exciting.

>>Landline lids or not, the network as you put it, is slowly fading away

It's just about impossible to really prevent internet forwarding, unless
of course, you plan on becoming a lock out lid (gee is that one of your
old rants?) and block anything forwarded through a ham with an internet
gateway. Of course, you're also blocking those hams who connect
to that ham direct on ham radio but that's your decision. Packet radio
is thriving in those places where internet connections are really
expensive or uncommon possibly, but making packet connection to
the internet illegal doesn't make hams use packet more, it can't.
Frankly someone looking for info on how to modify let's say a rig for
9k6 baud operation is better off on the internet than relying on
packet radio to get such info.

>You, Art, are part of what is sucking Amateur Packet Radio in the US down.

Gee, was that you who railed against the YU ham whose letter is in
QST? Is that a sample of the type of hamdom you want, where someone
asks a question, and you attack and flame for being a landline lid?
I've probably been a ham longer than you, may have even helped put up
more packet nodes and such than you, now why should I accept your
definition of a true ham, when I find my actions acceptable?

I am still waiting on Hank's reply to my message I sent yesterday (or was it the day before, the slow response time causes me to forget, honestly, I am wired to run at internet speed). I do like packet for the in state stuff (though I am not convinced it works at that distance), as it allows me to keep in contact with friends in the area, say like one, who is now at a secluded camp with only his packet station. Very nice for that sort of use.

> Forwarding bulletins is not magic - you can forward them anywhere,

The reason I believe ATCPIP should have been adopted. The very nature of the network guarantees a level of routing that can't be topped by the BBS's, whether

BBS's world wide network claimer/advocators like it or not. I'm sure that I will be attacked in light of how it will route messages when it doesn't exist. Thats not the point. If it existed, if given a chance, it would have fulfilled the role of message routing *much* more effeciently. To argue that is to argue the internet doesn't really work, when I have first hand knowledge that it does, and quite well.

I have to agree. Msgs never took more than a day or two at the longest.
But, things have changed...and a lot of the links (and the interests)
aren't there anymore. But, yes.. I'm one of the remaining sysops that
still maintains a BBS in our region of Texas. Guess I'm as stubborn as a
mule.

>> Bill Nelson (billn@peak.org)
Well, Damn! We better let the FCC know about all the violations
around the country! In this area (Raleigh, NC.) we have two
television stations that have helecopters for ENG - these helecopters
frequently transmit on the same 2GHz microwave band to send video &
audio back to the newsroom that thier land trucks use. I'm sure that
they also have commercial UHF radios in the aircraft to coordinate
setting up the shot with the engineering department. Remember the OJ
Simpson "chase" that was broadcasted live? I bet they were not sucking
up 6MHz of the aircraft band just to transmit that back to the studio.

There is also a traffic patrol service in this area that uses UHF
commercial radio to transmit traffic information to several local
radio stations from thier airplane. Oops - I'll be calling them too
to let them know this is illegal! And just think - the next time you
make an in-flight call from a 747 on thier air-ground telephone
system, you'll be breaking the law!
And jeez, I'd hate to think about how many laws AirForce 1 breaks with
all thier communications!

hehe

From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6oki63$sfc@enews4.newsguy.com>
Source record: 23155

Today I recieved the new 3.3g (Dos) version of PC-FlexNet, and upgraded MY v3.3e version, which I set up several months ago. So far I have never seen PC-FlexNet "crash" or "freeze up". It just works.

Upgrading to the new version entailed shutting down the node with the Flex /U command, copying the new files over the old ones, then restarting the node. The node was offline for less than five minutes.

I probably spent more time getting my cup of coffee just right this morning than I did upgrading the node software. Both of them worked out great.

FlexNet would of course work with 300 baud. The problem is in the
hardware drivers. I asume you are trying to get the SER12 driver to work
with 300 baud.
Try "fset mode 0 300c". But I'm not too sure if SER12 supports 300 baud
operation at all.

BTW there are really better ways to waste bandwidth than 300 baud FSK
packet radio on HF....

>I would have had to have seen your BBS in action to see if you ran it or you
>turned it on and watched TV.

You can't refute what I said, so you intimate that I'm a liar and toss
in a free insult, too.

>And why did you STOP running a BBS ?

None of your business, but I didn't stop. The BBS is still running,
at a different site, and I'm a co-sysop. Since all the links are
gone, it's on autopilot and doesn't need any "running."

>More fun to argue in near real time on Usenet ?

Irrelevant and insulting.

>I ran a BBS for five years too, Glen. And even when we delivered mail
>to the U.S. via satellite, most of it went one place - the bit bucket. The

Irrelevant. What happened to your BBS does not prove anything about
the national or world network.

>U.S. packet network never was reliable for anything but across town for one
>reason - too many people 'running BBS's' in the autopilot mode. Turn on

That is simply untrue.

>the software, pat yourself on the back, add 'SYSOP' to your resume,
>and go watch TV. Any bubblehead that downloaded a copy of FBB was
>an overnite 'sysop'.

FBB was not even around during the heyday of the net. I used AA4RE.

>Any network is only as good as it's weakest link, and the amateur radio
>packet network never was composed of anything BUT weak links. The

Another untruth.

>imaginary 'global packet network' the Charlie keeps babbling about was

It was hardly imaginary. I once delivered a personal message to a
Seattle BBS that originated in Moscow, Idaho, and arrived here without
ANY telephone links. As I recall, travel time was about 3 days.

>detined to fail by designed l - if 100 people routed and forwarded mail
>correctly, all it took was one more system not set up correctly to dump it in
>the bit bucket and defeat what the other 100 had done correctly.

That may or may not have been true for some private mail, but not for
bulletins. Even the Post Office, with billions of dollars to work
with, often loses mail.

>In 1992 I wasted the effort of dragging a notebook computer, a radio,
>and a TNC on a trip to the states with me. I put a bunch of packet
>mail on one of the main BBS's in the Washington, D.C. area. Two
>weeks later when I left, it was still sitting there, not forwarded anywhere.
>I went nowhere in the U.S. on a six week trip where I could send a
>packet message and recieve an answer.

Well, that's part of the explanation. By 1992, the network had
started to fall apart, thanks in part to the influx of Lockout Lids.
You're evidently a latecomer to the packet BBS scene.

>One time I asked a guy who was patting himself on the back over
>reaching message number 100,000 on his BBS 'How many of the
>100,000 messages that you have forwarded do you thing reached
>thier destination ?' His answer was 'If 50%, I'm happy'. That's
>why the packet network never was....

Nonsense.

>Forwarding bulletins is not magic - you can forward them anywhere,
>you don't have to figure out routing. Forwarding mail that has to go
>to a specific place is another story, and one that ham radio never
>could figure out how to tell.

More nonsense.

>>I don't see where your brand of vitriol is any more constructive than
>>Brabham's.

>What Charlie Boy fails to comprehend, is that the amateur packet
>radio network is useless be it radio links, telephone links, whatever.

Charlie is a jerk, but that doesn't mean that everything he says is
wrong.

>Anyone forwarding packet bulletins irregardless of how they forward
>them is doing it for one reason - it's something to do, more toys to

Duh! That's a fair description of A HOBBY. Ham radio is a hobby.
Q.E.D.

>play with. Networks are designed to diseminate information. What
>information can you distribute on packet radio that you can't distribute
>via other means ? This is 1998. Not 1972.

Once again, ham radio is a hobby; something you do for other reasons than efficiency. This is so obvious that even you should be able to see it. Doing ham radio comms may not be the most efficient way to do things, but hams do it because it's part of their hobby, not because they think it's the best or only way to do it. This whole stupid argument reminds me of the Code/No Code nonsense, where most of the people involved manage to miss the whole damn point.

>Charlie Boy wants to be a 'sysop'. And we don't need 'sysops' any
>more. Nobody in thier right mind would think about using packet
>radio as opposed to email. That's why we are discussing this HERE
>instead of on the 'global packet network'.

Nevertheless, you posted bollocks and I called you on it. You said that there never was a functioning BBS net in the USA, and that messages didn't get from one coast to the other without being relayed through Europe several times. This is a flat-out lie.

I usually don't bother to read or reply to your babbling, because you seldom have anything of value to read. This untruth was so outrageously blatant that I felt it was important enough to refute it, so that those who weren't around at that time would not think it was an accurate picture.

Your reply was long, insulting, and irrelevant, but not one word of it refutes what I said, or validates what you said. All you did was toss out red herrings and erect strawmen.

Nice try, though, considering the source.

3225. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-16 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6olli5$ke8@news.Hawaii.Edu>
Source record: 23159
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to:
majordomo@piobaire.mines.uidaho.edu and only write:
subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see
http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

I snipped out most of Jim's message. When he wasn't denying that the packet net existed, he was talking about how poorly it worked. He went on at length about how useless a pursuit SYSOP'ing a BBS is, how worthless the whole concept of Amateur Packet Radio is, ect, and so on.

Yep, you can sure tell a LandLine Lid by his smell! ;-)

Jim "SYSOP"s a *NOS BBS on the island of Gaum, forwarding tons of stuff every day over the Internet, so that competent Hams will not be able to set up or operate HF forwarding links at his location.

That's right, you can see Jim's call on the "LandLine Lid List". He's a typical Internet forwarder.

Notice the hostility he displays toward the Amateur Packet Radio network? Yet, he somehow finds it rewarding to "participate" in this thing he despises so... Just so long as he can participate in a destructive, rude, and juvenile manner, by operating a "LandLine Lid" station which prevents genuine Amateur Radio operators who care about the hobby from building and maintaining an all-Ham digital network. - He's a "Packet Hacker", who participates in the network only so far as he can run it down and undermine it.

Human Spam, in other words. The lowest kind of trash, who takes delight in disrupting the work and fun of his betters.

Think about Jim when you think about Internet Forwarders. His alleged "reasoning" is fairly typical, as is his essential lack of respect for his fellow Hams.

How has "he" stopped "them" from doing anything? If "they" were concerned about "him", "they" would be setting up the radio links and boycotting "his" station. Where does the line of distinction exist between "they" and "him"? You are implying that every competent operator on the island isn't interested in ham radio or doesn't care about your agenda. Just simple logic. Think about it.

Also, please include the normal insults and attacks, or I'll feel favored or something.

No, just simple ignorance on your part, David.

I remember holding your hand and leading you through this earlier this year, and am not interested in playing any more 'idiot games" with you. Either you are terminally stupid, and so explaining would do you no good, or you are simply so hostile that you have no intention of learning anything. Either way, I'm about through wasting my time on your ignorance, whether it be real or pretended.

Your normal reaction to information appears to be to deny it's existence or 'call it a lie" if you do not want to hear it. Yep... "Ignorant" describes your behavior here perfectly.

Find another Lid to ask questions, if you want answers from me.

Honk. Wrong answer. Jim's the 'sysop' of nothing. Jim doesn't forward anything anywhere..... The past is over, Charlie, this is the present.

Jim has realized, long ago, that it's 1998 and there is no practical use for a packet BBS.

>That's right, you can see Jim's call on the "LandLine Lid List". He's a
>typical Internet forwarder.

>Notice the hostility he displays toward the Amateur Packet Radio network?

No hostility involved. Just the realization that the time for packet BBS's is over. Time to go play elsewhere.

>Think about Jim when you think about Internet Forwarders. His alleged
>"reasoning" is fairly typical, as is his essential lack of respect for his
>fellow Hams.

Think about Jim when you think about the truth. The truth is, there is no sense of anyone spending money on packet radio equipment thinking that Charlie is going to forward mail for them on his 'global packet network'.

The truth is, APRS is usable, packet clusters are usable, but mail forwarding via packet is at best a bad joke.

Wake up, Charlie Boy, it's 1998. Time for you to find something new to do.

>transgression and put him on the LLL list.

Let me explain it to you, David. First of all, Charlie specializes in blowing smoke out of his lower posterior anatomy. Charlie is upset because he just can't face the fact that in 1998, there is no need for packet 'mail'. Charlie can't face the fact that as a 'sysop' his services are no longer needed. So he needs someone to blame his failure to see reality on. He doesn't care who, anybody will do..... Charlie is very hostile, so anybody with a different opinion automatically gets labeled hostile.

The hams in my area aren't interested in forwarding packet mail, irregardless of how or where it gets forwarded - all the hams in my area have ISP's and email on the internet, so there is no use for packet mail.

The hams in my area use packet radio for what it's good for - APRS, and a DX packet cluster. Nobody wants ARRL bulletins on a packet BBS next week, when they can get them at the ARRL website today.

Packet radio BBS's were fun - they never were very efficient in terms of real world standards - but a lot of hams, me included, had fun learning about packet radio, computers, and software. Digital satellites were fun, and UOS used amateur radio as a beta test for some commercial stuff. A lot of hams had fun learning about satellites, satellite tracking, and how to set up an automated satellite station, me included. But time marches on, even if Charlie has both feet firmly stuck in the mud.

Charlie is not upwardly mobile - he wants the technology of yesterday to remain forever, but that never happens.

Charlie was probably as pissed off when they invented television as he is because of the internet.... If there was a packet network in 1951, Charlie would have been sending out lists of 'TV LIDS'....

Charlie has a self created hatred for anything involving a telephone, but if you notice, he's dialed into his ISP preaching the gospel of packet radio, not connected to the local BBS, because he realizes he has no audience on the BBS anymore, and he likes to preach in real time....

Things change. But Charlie can't. And he can't accept the fact that he can't. So he needs someone to blame it on. Me, you, anybody will do. That's Charlie....

>ham radio would be legal.
>aa7qa mike

Many airlines have policies regarding this which the pilots are not allowed
to override.

In the NTSB records I read a report of uncommanded severe rudder movements
on a
large plane when the comm transmitter was keyed. 25W, AM in the 116-135 MHz
band. The problem was traced to a broken coax shield connection at the
antenna,
causing excessive RF to affect the yaw damper control module.

Are you SURE you want to transmit from a plane you are on?

Also, the regs are stiffer for air carrier and IFR flights, where portable
electronic devices
are prohibited (except for tape recorders, hearing aids, pacemakers,
shavers(!), or "Any
other portable electronic device that the operator of the aircraft has
determined will not
cause interference with the navigation or communication system of the
aircraft on which
it is to be used.") [FAA reg 91.21]

Paragraph (c) further clarifies that for an air carrier, the determination
shall be made by
the certificate holder (as different from the Pilot In Command). So you
will have to get
Delta or whomever to give you permission.

I wish you luck in this endeavor!

Or something else.

In any case, I would say that a radar altimeter failing in some way, by
itself,
wouldn't by itself be a reasonable primary cause for CFIT; pilot error or
some
other cause would be more likely.

> or pretended.
>

I am not hostile, I simply don't know why the HAMS in his area can't do something about it if he is so bad of a landline lid? They don't so therefore they must be lids too by your reasoning, yet you blame Jim alone for the transgression and put him on the LLL list. You need to add all of the HAMs there who use the system. Oh, and how is he blocking them? Jamming is illegal, which is the only way I could forsee that happening. Will the mail feed who feeds the accompanying link who sends him traffic not serve a radio connection to the other HAMS? He is lid too, don't forget him, if that, in fact, is the case.

If they setup their feed over radio and quit using his, will he not go away or at least take a position of uselessness? Why yes it could happen that way, but they don't, so like I said, add them to the list, too. What is your reasoning for not? And no, you have *never* explained that to me. I think its because you don't know what you are arguing about, nor do you even have an inkling of what motivates the packet radio forwarding system. I don't have a perfect picture of it, but one things for sure, you don't either, because your own arguement disagrees with your own methodology of updating the LLL list, as well as shaping your arguments and focusing negative attention on your naysayers. Either get consistent or quit debating.

As to you being "about through wasting my time", good, wearing you down. Maybe you'll quit posting useless insults and personal attacks to those who disagree with you, and the general misinformation about A-TCPIP you spread to the internet, and keep to the Flexnet posts and other helpful data you actually do provide. Every cloud has a silver lining, after all....you need to expose more of your silver lining more often.

Thats also a classic backdown line....lets not forget.

> Find another Lid to ask questions, if you want answers from me.
>

I know this is a simple rift in logic, but you called yourself a LID. I think it fits, as accidental as it may have been.

I think I would have a much different opinion of you if you actually held your views as opinion instead of the pure, unadulterated fact you claim/spew. I would say to that guy, yeah, we should encourage these people to put up radio links and take down the wirelines. But no, you raise them up as targets of some personalized vendetta of yours, tell them to get lost, etc. There is just as much technology and know how present in a inet forwarding operation as a BBS system, most engineer would say much more, yet you choose to dispose of these people. Are you funding them? No. Are you insulting them anyway? Yes. Take what you get or fund the radio links and encourage those forwarders to switch. Donations to buy the needed radio equipment are always a good way to get someone to change their mind.

One more point: Its funny too how this Inet forwarding is having such a large effect on packet. My message hasn't gotten to Hank, yet, or at least he didn't reply....you would think with all the wireline links we have, that baby should have been there in less than 10 minutes after I sent it. Obviously it doesn't exist to the extent you would like to believe. Hey, the facts speak for themselves, and they are saying your major breakout of land line lid infection is complete fiction.

Source record: 23170

Why has Packet Radio here in the U.S. been in a decline for the last decade, while it has continued growing and advancing in Europe? In Europe, the practice of "Amateur Telephone" and "Internet Forwarding" is simply illegal in most places. They have no LandLine Lids there. That's the main difference between Europe and the U.S.

How do the LandLine Lids in the U.S. manage to screw things up so badly here? Take a minute to think about this:

Ten, or even five years ago, a NodeOp or BBS Sysop could feel reasonably certain that his effort would be appreciated and utilized by hams for years and years.
Both node and BBS operation require long-term dedication, and that's generally the kind of hams who are attracted to providing this kind of service for their fellow hams.

Unfortunately, these days both Node operators and BBS Sysops know that at any given time, their efforts can be summarily destroyed by any Lid with a telephone modem and amateur tcpip software.

These "Packet Hackers" tend to undercut and run off the very people who are most crucial to the Ham Digital Net's continued survival and growth. - The ones who would like to be able provide long-term, significant service to their fellow hams.

You have seen the "LLL" bulletins? Well, those SYSOPs who are working to end Internet Forwarding of Packet Radio bulletins are making an effort to take the network back from a group of such hackers. The "LandLine Lids" have shown no remorse or evidence of conscience for the damage they do to amateur packet radio and their fellow hams every day.

VHF/UHF networks are under the same hanging cloud, and this is why most of them in the U.S. have slowed or stopped the amazing growth of only a few years ago. The virtual halt to the development and growth of TexNet occurred at roughly the same time the "wirelines" were utilized. The wirelines went in and soon after, the growth of the Texas TexNet RF net came to the dead halt we have experienced for five years or more.

Consider this quote from (of all persons) the president of TAPR, Greg Jones WD5IVD: Maybe you have read it before... Maybe you should read it again.

--- From the 8-96 issue of the Texas Packet Radio Society's Q-Report: ---

WD5IVD:

>Some might say that I have just made a pact with the 'Dark Side of the
>Force' by saying we should use wirelines and the Internet to connect
>regions in Texas, Arkansas, and Oklahoma and the U.S. at high-speed.
>My answer is no, we don't turn off the existing TexNet backbone, but use
>it for what it is good for, that of providing long-haul RF paths when
>our primary high-speed routes die.

>Many might say that the commercial wirelines are unreliable; however, the
>commercial world is learning every time there is a disaster that takes
>their equipment off-line. Soon, many commercial systems will not be
affected
>by earthquakes and other such natural disasters.

---------- End of Quote: ----------

Here Greg says that he intends to put the entire high-speed TexNet Packet Radio network on the back-burner in favor of commercial telephone links. He generously allows as to how packet radio could serve as a "backup" for the telephone, then goes on to explain how unlikely it is that it will be needed even for THAT purpose.

After reading Greg's alleged "reasoning", would YOU be interested in taking on a long-term, expensive and difficult service project as a ham, such as a Node or BBS, knowing that any jerk with a telephone modem can put you out of business overnight, at any time?

They do this by "routing around" the genuine ham radio stations with faster telephone links. They undercut the hams, and replace them with utter dependence upon the phone company and the Internet.

THAT's why more and more BBS's and nodes are shutting down in the U.S.. Five years ago, we had an independent, global amateur radio digital network to be proud of.
Now we do not, and a lot of hams have become disgusted at what a small clique of hackers have done to the Ham digital net. They are even more disgusted that nobody has attempted to DO anything about it - Until now.

The greater part of the "Ham Radio Digital Network" has been taken over by LandLine Lids, while TAPR and TPRS has egged the process on, and the ARRL has sat on it's hands.

It's cheaper, and easier to use the phone, and with irresponsible persons such as Greg Jones and Phil Karns activily promoting the utilization of "Amateur Telephone" in preference to Amateur Radio, the problem has snowballed into a major catastrophe for Amateur Packet Radio in the U.S..

So much for amateur packet radio. We have no legal protection from these hackers, because no-one thought anybody would be low enough to "hack" amateur radio.

Sadly, they were wrong about that and now all hams in the U.S. are paying the price.

Contact me if you would like to be part of the solution. Everybody can do something in the fight to get our packet radio network back. You don't have

to be a NodeOp or Sysop. Any concerned ham has a right to both speak and act in this matter.

Let's take our network back now.

Be a Ham!

I've loaded and run the Flexnet soundcard packet programs and would like to know more...I've noticed that the MH and help functions in the Baycom terminal program don't seem to work. Any suggestions?
Has anyone put together a good set of English docs?

Another thing I'd like to do is figure out a way to make the incoming packet data "appear" to be at a serial port for my Street Atlas mapping program. I've been able to get it to plot the position beacons with a regular TNC attached, now I'd like to eliminate the TNC and use the soundcard instead. Once again, I'm open to suggestions.

> difference between Europe and the U.S.

There are many other differences in the Telco realm between Europe and United States. In most of Europe, you pay per minute for telephone needs therefore anything that provides Internet like services without the per minute charges is seen as a win.

I know you like to simplify all the problem with packet radio down to the fact that people are using non-radio technology to communicate. It just isn't that simple. I've ignored packet radio from day one for two reasons. the first is speed. I've always had faster modem and network connections than packet radio could provide. The second reason is content. There is zero content in the amateur radio network that interests me and I can't use the amateur radio network to get anything of interest (besides dying of old-age while I'm waiting for it to arrive).

I think you'll find that if we had much higher speed networks, content would develop which would in turn attract users which would then build up the network. If we ever get any high-speed spread spectrum radios for relatively cheap money, my contribution to building a real radio network will be to put up a node (radio plus server) and let people the local ham radio community play with it. If we could do away with content restrictions (but keep the no commercial clause), I'd probably stick in a caching proxy to the Internet and other gateways (remember, it's content/functionality that draws users)

(I'm probably going to regret saying this but I'll say it anyway. It's extremely blue sky)

One role amateur radio could play in the community service arena is that of providing high-speed communications to schools and neighborhoods. We could do this with high-speed spread spectrum radios as the fundamental technology and we could probably attract enough people that would want to participate that a reliable mesh network could be built.

The obstacles are obvious. Some are regulatory (content restrictions, responsibility for content, no compete with telcos) others are more of a human nature. The technological side is a cakewalk compared to the human obstacles.

The reason I'm interested in this is that I've never been entirely comfortable with the Internet residing entirely on commercial backbone. I've seen so many screw ups by telcos that it's amazing the Internet works at all. Would hams

screw up any less? Probably not but it would be intriguing to see if hams can pull their thumbs out of their collective butts and put together a real high-speed nationwide network. Heck, I'd be happy with a real high-speed New England wide network... (uh, how about an inside 495 network??)

Anyway, step back from the technology and look at people (service consumers) to see why things succeed or fail. Packet radio can have a resurgence but only if we leapfrog current communications technology and provide content and services equal to or better than what one can get commercially.

No content => no users => no network

Looking for information on baycom modems, I would like to build one myself so I am asking if anyone knows where to find the plans, kit, schematic etc... I really don't want to lay out $50.00 to tigertronics if I don't have to. Yes I want to build it, I own 2 tnc's right now but just want the fun of building something for amateur radio.

Thank You
Jim Ernsberger

I am an airline captain who flies a DC-9 in the USA. I can tell you that in the US weather or not you can operate amateur radio aboard an aircraft is up to the way any particular airline wrote its General Operations Manual (GOM). On those airlines that allow it as per their GOM, it is usually up to the Pilot In Command (PIC) or Captain to approve the use of any Portable Electronic Device (PED). Unfortunately it is not easily determined weather or not an airline will let you use your equipment until you are boarding a particular airplane and ask the flight attendant to speak with the Captain. Please remember that most pilots are not hams, and are not trained to determine the possible RFI from the use of amateur equipment; they may be very likely to be reluctant to let you operate!

Good luck!

That does appear to be the extent of *your* experience. Those of us with
functioning packet switched networks know different. We make extensive
use of many of the same applications which run on the wired network. I find
whiteboard conferencing applications very useful, most of us use email
(*not* BBSs), some people have websites on the network, and others use
their web browsers over the network (there are even a couple of web cams
running on the network). We're currently deploying a 50 station automated
weather reporting system for ARES over our network. We have done some
experiments with digital voice applications for repeater linking. Etc.

Again you don't know what you're talking about. Have you ever operated
on our network? No, of course you haven't. So you have no idea what sort
of performance we get. Under typical network loading, we still get about
4 kilobytes per second ftp performance end to end across the network.
I rarely see better than that on the dial up network.

>The real holdup is that High-Speed packet is strictly a local phenomena. You

>
>Gary doesn't come out and admit it, but what he is really talking about are
>a bunch of piddly little High-Speed packet LANS, connected to each other via
>the Internet. (Amateur Telephone, not Amateur Radio.)

Once again you show your utter and complete ignorance. Our network has eight MANs hubbed around network switches, all connected by 56 kb RF links spanning parts of 4 states and covering approximately 15,000 square miles. There is only *one* wired internet gateway in the entire network, run by one of the network users. It is a user service, accessable from our network, but not an integral part of the network topology. *Our entire network topology is RF based.*

Note well that I personally have no prejudice against wormholes to span large distances, but our network does *not* depend on that, and Charles' claim that it does is nothing but a bald faced lie.

>He's not talking about an Amateur Radio network at all. Perhaps this
>limitation is why Amateur TCPIP enthusiasts are so determined to run down
>and try to undercut the real Amateur Radio Digital Network. They have
>discovered that the telephone is not only vital to the existence of Amateur
>TCPIP, but that it can be used to destroy that embarassing Legitimate, Real
>digital Ham Radio Network which makes "Amateur Telephone" look so stupid by
>comparasin.

More nonsense. Show me *any* other amateur RF network with the performance and coverage of our TCP/IP packet switched network. Show us *any* other "Legitimate, Real digital Ham Radio Network" which can support 4 kilobyte per second end to end transfers across 4 states that doesn't use TCP/IP. You can't, because we have the only one that can do that, and it *is* TCP/IP based, and it *is* 100% over amateur radio links.

You don't have squat by comparison. But you could, if you weren't such a flaming asshole and were able to work within the framework of a networking organization which can fund and build such a network. We've spent over 18 years building such an organization, and 12 years building the high speed network. But we couldn't have done it by being sorry sons of bitches who only know how to run down the efforts of those who want to progress beyond 1978.

We've commanded respect, loyalty, and cooperation by delivering on the promise of a fast and reliable packet switched wireless network. You, OTOH, are stuck in 1978 and rail against those who realize it is now 1998, and that we have to do better than 1978 non-realtime linked toy BBSs in order to meet our users' elevated expectations.

If you can't deliver the quality of service provided by the wired internet, your users will abandon you for the wired internet. We've delivered for our users a network which is competitive in performance and services with the wired internet (though much smaller in scope of course). You haven't. We've maintained a large active user base. You haven't. You moan that your "network" is falling apart. We celebrate bringing another new switch online. You maintain an enemies list. We maintain a list of new

friends. There seems to be a pattern emerging here, but you won't get it.

A note to others besides Charles who may have read this far. Our network is far from perfect. We have our setbacks and disappointments. It grows much more slowly than we'd like. But it *is* growing. We aren't pissing and moaning about what others may be doing. We're concentrating on what we are doing, and trying to do that the best way we know how. And when I say "we" today, I mostly mean "they" since the leadership has passed into younger hands.

I'm justifiably proud of what GRAPES has accomplished, and of what it is still accomplishing. I won't stand by and let Charles try to tarnish those accomplishments with his lies and libels. GRAPES offers an example of what a packet switched wireless network can be. And any of you can have a similar network if you don't let nattering nabobs of negativism like Charles deter you from doing it. We have the proven technology, all you need is the will to deploy it into your own functional network.

This is not so, the FCC, FAA, and the airlines have written policies,
regulations, and laws regarding transmissions from an aircraft. It is
never permissible to for a passenger to TX on HAM frequencies from a
commercial airliner for instance. In general aviation during
instrument flight PART 97 gear must not be operated.

Source record: 23180

I working on trying to develop drivers for small handheld computing devices such as PalmPilots or Window CE Palm PC's to allow them to use their existing TCP/IP stack to communicate via packet over amateur radio.

My goal is to develop ultra mobile and self-contained packet stations that are able to interface to a database on a central computer in a Red Cross or other emergency center. It is far easier to implement applications on these small devices using TCP/IP as most of the built in applications natively support TCP/IP.

I have downloaded the sources from TNOS as well have been working with complete specifications of the AX.25 protocol. But was wondering if the method TCP/IP frames are transported over packet radio is documented anywhere and explained in any detail?

Consumer-device RFI and a 5 Watt transmitter are very different beasties.

I would tend to agree with you with the non-intentional emitters as the
energy
output is quite small, but a HT can really cause macro interference to
electronic
devices. Try holding a transmitting HT near a cash register at a
not-so-favorite
store near you!

You have some valid points, charles but your too passionate about the "purity"
of amateur radio. Think of it another way:

99.9999% of everything in the universe (just kidding!) is on the internet or
will be soon, what better way to attract new hams than to show people another
way to get to all this information. Sure the amateur networks have suffered
because of the internet, there's no arguing that, but there's only one thing
that the commercial networks can do that packet can't - speed. As soon as we
can resolve the speed issue then we can be competitive. As it is the pseudo-
packet networks still offer a wireless alternative.

My HF station is just sitting here gathering dust, since I don't have
much time for gabbing anymore, so I think I'll put an HF gateway on
the air. What frequency does your HF port operate on, Charles?
Maybe we can set up a forwarding schedule between Indiana and
Texas, and eliminate the need for landline forwarding between our
two states. Interested?

qwasty@hotmail.com wrote in message <6op0nr$tg5$1@nnrp1.dejanews.com>...

>You have some valid points, charles but your too passionate about the
>"purity" of amateur radio. Think of it another way:

Let's try not to forget that Amateur Radio is essentially about Radio.

>99.9999% of everything in the universe (just kidding!) is on the internet
>or will be soon, what better way to attract new hams than to show people
>another way to get to all this information.

Think of it another way...If "99.9999% of everything" will soon be on the Internet, I can think of no better reason to want to build and participate in a seperate network.

I suppose we all know why it's not clever to put all of your eggs in one basket? This is one reason why Hams use Radios, and it's a good reason to reconsider allowing the existing Amateur Packet Radio Network to be summarily tossed aside due to one's enthusiasm for the Internet.

>Sure the amateur networks have suffered
>because of the internet, there's no arguing that, but there's only one
>thing that the commercial networks can do that packet can't - speed.

A common misconception... Look at the quote below from Gary Coffman:

>>Even at "faster" speeds, your network most certainly did not perform as
>>well as the Internet. That's because there's a lot more to performance
>>than speed.

>Again you don't know what you're talking about. Have you ever operated
>on our network? No, of course you haven't. So you have no idea what sort
>of performance we get. Under typical network loading, we still get about
>4 kilobytes per second ftp performance end to end across the network.
>I rarely see better than that on the dial up network.

I mentioned that there is more to performance than speed, and Gary's reply was about how fast his "pet net" can go. His answer made it pretty plain that he paid only the most superficial attention to the statement he was responding to (or he simply could not comprehend it). It whizzed right over his head.

What do I mean when I say that there is a lot more to performance than "speed"?

(1.) Content:
Ham Radio networks will never be able to legally carry most of the content

found on the Internet. You can filter out certain sites, certain keywords, ect, but each time this is done, a lot of perfectly innocent content gets thrown out as well. The baby goes out with the bath water.
Fact is, even if ATCPIP was twice as "fast" as a regular Internet provider, (not likely, but possible) you still could not call the level of service you would get "competitive". - Because it legally cannot be.

Most of what is done on the Internet cannot legally be done over Amateur Radio networks, and I'm not just talking about "feelthy peectures", either.

Like just about everybody else, I will expect very high performance in my Internet connection - Much better performance than can be hoped for on a junior "Ham Radio Internet", at any speed.

(2.) Cost:
I pay twenty bucks a month to my ISP for all the Internet I can stand, and my modem cost me less than one hundred bucks. For this cost, I get full service, all content, and at high speed. (And several E-mail adresses, and 5Mb for my Web pages.)

An Amateur TCPIP net cannot provide the same level of performance at any price due to the legal considerations mentioned above... What it can provide is a castrated, incomplete "simulation" of true Internet service, as long as you are willing to spend a lot of extra money and time on equipment. - A lot more money and time than Hams have shown themselves to be willing to part with for that purpose.

>As soon as we
>can resolve the speed issue then we can be competitive. As it is the
>pseudo-packet networks still offer a wireless alternative.

I wish it was as simple as that... I don't suppose many of us have given much thought to the performance you can expect at (insert speed here) over a shared Radio channel as opposed to what you will get at (insert same speed here)
over a dedicated telephone link?

Think of it another way:
Hams can expect their 19.2kb Rf links to perform about like 1.2kb telephone links. - That's a good rule of thumb that pretty accurately conveys what you can expect to get.

Fact is, there has been an awful lot of hype about high-speed Packet, and what it will and will not allow us to do as Hams.

One thing you can rest assured about though, is that AMPRNET will never, ever be "competitive" with regular Internet service. I think that as the initial excitement about the Internet wanes and 'net users start to focus more and more on performance, the quaint idea of "Ham Radio Internet access" will slide off into the obscurity it deserves.

I was using a 1278 with a program called BMKMULTY with a 486 computer. I presume that you have the level shifting dips in the 1278 so that it matches the computer.

But, if the consumer device radiates RF energy on the frequency you are trying to receive there is no way for you to filter out only the interfering signal at the receiver. You could require all consumer electronics to undergo testing and FAA certification but then that gameboy would probably cost you about $5000.

Dazed and confused in Texas.

Charles on one hand bemoans the lack of good connectivity on packet.
He slams the ham community for using land-line internet connections
to bridge between ham sites. He calls these "landline lids".
He chastises the community for not creating good RF links and creating reliable
efficient RF pathways. He offers no technical or logistical solutions for
solving the problem. He builds no networks of his own to serve as examples of
how it should be done. He does all this on the landline internet he supposedly
despises.

Now he espouses a complete reversal. Hams can't "compete", so why bother.

Charles simply likes to stir the s__t. He has no agenda except attracting
attention for himself and to inflame his favorite targets.

Agreed 100%... I'm not talking about a ham with a transmitter.
Crunching a receiver front-end with a 5W HT's near field is a very
different problem altogether. (Which still shouldn't happen, but I've
been told it's too expensive for our multi-million-dollar passenger jets
to be equipped with modern radio technology.)

Instead, I was referring to the air transport world's reliance on
deep-fringe reception of Marconi-age modulation types that may (or may
not) render it possible for emissions from Part 15 devices, FM receiver
LOs, etc. to pose a safety risk.

Doubtful, GRAPES has proven that it is a highly desired option, and they plan on Slovenanian-equivalent speeds soon. Those will compete directly with ADSL in the home in their network Put another way, these people like the idea of radio networks, and they like the idea of radio networks that extends themselves to new users in terms of sheer performance. My generation is a generation raised on marketing, to attract those of my age group to the hobby, most of them will have to be "sold" on the idea. The interest in the hobby will more than likely come later for these operators after they are established on the network and wonder about the anomolies, etc., that effect it, or talk with others on the network who have other interests within the hobby.

I'm sure you will disagree with that statement here in this forum, but you will agree for yourself. I talk to non-amateurs nowadays that know about the hobby, and they just think we are the most antiquated hobbyists around, too much of the good old boy sentimentality, of how we think about things and how they should be a certain way, and that we don't experiment like we used to. I know that I'd like to change that, and one approach is to build something better than the telephone network can provide, not whine that it can't be competed with, and complain about amateurs who do not view the hobby your way. At one time, amateur radio more than competed with the phone network, it ruled it from a perch on high. That same sort of advantage could exist today if we were actually interested in technological adavances as we once were, but as a group, we aren't. There are innovative individuals, but they are so few and far between, that the good 'ol boy mentality has taken over. We are constantly told how we can't read faster than 120 cps anyway, or how TCPIP - a networking protocol basically custom made for networks requiring redundancy - are inferior to the amateur callsign based protocols, or how only HF phone/CW can provide reliable emergency services, or how spread spectrum HF could negatively effect non-spread transmissions. I view that as complacency, and lack of knowledge. not as the attitudes of a technologically advanced hobby. Any of the prevalent attitudes in amateur radio can be demonstrated by a HAM just down the road from *you*.

So how about some explanation on how it would be done. Don't forget you have no prior knowledge of what type of signal the consumer electronic device will put out or exactly on what frequency it will be or how strong it will be or how wide the sidebands will be. So how exactly do we guarentee that no signal, no matter how strong, how broad, with any possible modulation type will not interferre with, for example A.M. communications, even if the interferring signal falls within the passband of the aircraft receiver?

I have a data point here. I got pretty much most of the ham
radio stuff -- you know, FM, and HF and Pactor and CW. The whole bit.
But, you know, I never talked to very many teen-agers. I can't count
the times I've heard 'AGE IS 75' or something on CW. But, when I hooked
up to Ampr-Net here in the bay area, I ran into like 5 or six, uh, kids.
All pretty much between say 15 and 22 -- some at college here in Berkeley
and some living with their parents down in San Jose. I really
think that ampr-net has potential of being a 'gateway drug' do
the rest of ham radio.

I haven't heard about any of these guys ever mention say, forwarding
of NTS messages over the net or such things, which I agree is a bit silly.
I really don't think most ampr-net people are really that interested
in packet message forwarding -- for or against. Mostly, it seems what
people use the thing for is putting up web pages, email. Also, suprisingly
IRC. A kid living in his parents house can't always dedicate a phone
line to sitting in and IRC chat room all day. But, they can use the
amprnet to monitor the hamradio chat room on irc. You bring up IRC
over the ham radio link in the hamradio room and leave it up all day.
When one of your buddies says something then you reply.

well said david.

I think we hear so much "negative" from charles because, frankly, he's frustrated - and for good reason. I was pretty frustrated when I first started looking at packet radio; Everyone always *talked* about what was possible but they could never *show* or *explain* to a novice just exactly *how* I should go about doing some of these fascinating things. I had to figure it out myself, it took a while but I did it. I have 1200bps internet access via packet radio, and I'm using my calculator as my terminal. That all sounds fun and interesting, and for me it was because I enjoy tinkering, but most people are too busy, don't have enough free cash, or whatever. And that's OK, now that I've figured it out and spent all MY time and money, it will be easier for others to repeat it.

That's all most people want, a cheap and easy way to do cool stuff. I think that Charles will find that things aren't so bad if he were patient and at least waited quietly for others to develop the appropriate technologies, or he could become an active participant if he has the time and money.

BOTTOM LINE: radio is cool, the internet is cool. if you put them both together, aren't they twice as cool? It's the best of both worlds.

Does anyone know if the Acer FX-3D sound card that uses the Analog Devices AD1816AJS chip qualifies as a better-than-soundblaster board?

I am interested in VHF packet (1200 minimum, don't know if there is any 9600 access here in southern NH), and HF amtor and pactor modes. (CW might be fun as well, but is not critical.) What software are folks using successfully out there?

Another aspect about the decline of "packet networks" that I disagree with Charles on:
In My Un Humble Opinion, the "Automated Forwarding" and BBS-based monopolization of the packet networks are what KILLED packet radio. The guys who did much if not most of the work in setting up nodes etc. were interested in BBS operation which resulted in a packet network that not only was dominated by BBS forwarding and TCP/IP header exchanges but truly frustrated the new "Joe Ham" packet user who tried to log on and use the "system". I think it was a mistake to belittle and discourage keyboard-to-keyboard packet usage since the great majority of HAMS enjoyed that (in the few places where they could find other keyboarders to communicate with) MUCH more than logging on to BBS's.
For several years, during the packet explosion and during it's rapid decline, I and others used packet radio as part of the curriculum in ham radio courses we taught at Los Alamos Middle School and Los Alamos High School. I was always surprised at the reactions students expressed when exposed to Packet Radio. I saw NONE who were interested in the LEAST in BBS connections and use thereof. BTW, this was BEFORE the internet explosion. But, in the few occasions where we were able to connect with a LIVE "keyboarder" packet op, the interest was unbelievable. The kids who were "mike-shy" really were excited about keyboard communication, and everyone else thoroughly enjoyed it also, for various arguable reasons.
My point is that packet radio "powers" quickly became enamored by automated forwarding and BBS domination and at worst tried to belittle or discourage "keyboarders" who might otherwise have turned into packet supporters and movers and shakers. This was kinda hard to happen since 9 out of 10 (or maybe 98 out of 100) new users of packet radio gave up in disgust within a month or so after trying their new TNC the first time.

Source record: 23011

I run DOS APRS v. 8.16. It ran fine under Win3.1 and Win95.
I upgraded to Win98 and things are screwy.

When I run normal packet, using PC Pakratt for Windows, everything runs
just fine. but, when I run APRS under Win98, here is what happens:

-- the map screen shows, as usual, with my QTH plotted on the map.
-- APRS starts and tries to communicate with the TNC.
-- I get the message TNC not responding.
-- When I try to QUIT, the system hangs up and I have to do the
CTRL-ALT-DEL then End Task under Windows.

I have heard a rumor that there may be some sort of conflict with the
way that win98 handles the COM ports under DOS.

Anyone out there have any suggestions?

I am posting this same request for help on the TAPR APRS SIG.

Thanks,
Joe

Hi Joe,

I don't have an immediate answer regarding the DOS version... but I would like to confirm that WinAPRS (2.2.0) works fine under Windows'98 (maps, radio and TCP/IP links)

I have heard about similar problems... If I learn anything, I'll post it here.

Your analysis is flawed. First of all, it's relatively easy to set up a network where both direct and BBS ops can co-exist, IF the parties involved understand how to do it and are willing to cooperate. Furthermore, packet is a multi-user SHARED resource, and no matter what you're doing, a busy circuit is going to experience delays. Even the Internet often suffers excessive and frustrating delays and disconnects, and you can't just blame that all on UseNet forwarding, which is the equivalent of BBS ops on Packet.

Besides, based on ten years of observation, I found that there was not nearly the prolonged interest in "real time" comms as you suggest. Oh, sure, it's fun for a while, but eventually folks discover that if you want to chat, it's a whole lot easier to just pick up the mike and do it on two meter FM. They found that leaving messages on BBSs and mailboxes was far more efficient for packet than live chat, even when there was NO forwarding going on. We have CHAT mode enabled on all our user nodes, and after the novelty wore off, they got no use at all.

If BBS forwarding contributed to the decline of packet, it was a fairly minor one by comparison to other reasons, and even that congestion could have easily been avoided by a bit of planning and coordination. Most problems of this sort arise from improper settings of BBS and Node parameters. I've done a LOT of experimentation with this, and our system was set up so it could forward bulletins with little or no significant interference with real time comms, even over several hops.

>My point is that packet radio "powers" quickly became enamored by
>automated forwarding and BBS

That's because store and forward messaging and bulletins was by far
the most efficient use of the original low-speed network. In most
areas, it never got improved enough to get past that point.

> domination and at worst tried to belittle
>or discourage "keyboarders" who might otherwise have turned into packet

>time.

I didn't see that happen here at all. I'd say that at least 7 or 8 of
ten newbies enjoyed packet and stayed with it for several months or
years before moving on. Anybody who gives up on a new facet of the
hobby in a month is not the type of person who is going to enjoy it in
the first place. When I got on packet and found a huge problem
connecting locally, I got together with friends and did something
about it by putting up a BETTER network. That's what ham radio is all
about, not pandering to a few weenies who want to play with their new
toys without putting in any effort.

And that's the TRUTH, my friend.

Hamfest - Gaithersburg, MD - September 13

FARFest '98, the *last* Gaithersburg Hamfest, will be held
on Sunday, September 13, 1998 at the Montgomery County
Fairgrounds in Gaithersburg, Maryland.

Gates open at 6:00 am.

Take I-270 to exit 11 northwest of Washington, DC. Follow
the signs to the Fairgrounds (Montgomery County Agricultural
Center).

Talk-in on 146.955(-) MHz.

Special event station W3PRL-AM (Rock XV) on 3885 and 7290 kHz.

Admission $5. Tailgating $15.

All proceeds go toward the support and administration of the
57+ educational scholarships that are funded and supported
by the Foundation for Amateur Radio (FAR).

For more info, contact:

Al Brown (KZ3AB) at 301-490-3188, or
Mary Morris (N4TCI) at 703-971-3905, or
e-mail at Amateur_Radio@hotmail.com

In 1999, FARFest is moving to Bowie, Maryland.

Jim Devenport made some really good comments about the decline of packet networks.

When the packet network was initially being set up, it was a real interesting challenge to see how to interconnect the various nodes and routes. Like you usually see in this type of activity you have those of us who really enjoyed the technical part and also the practical part.

Unfortunately, there are the power freaks who see this as the latest way to have what they perceive as some sort of control over others. This works for a while since they initially come across as a benevolent dictator(s). But then you realize that they are trying to reduce the fun of amateur radio for others. Example, a local bbs sysop was livid that another ham in a community 30 miles away wanted to learn about and operate a bbs. Needless to say, the "new" ham did not set up a bbs.

At first the technology does something that is not available elsewhere for an affordable price to the average person. But as the network bogs down with more and more bbs messages, the power structure prohibits the use of the long distance real time interconnect of keyboard to keyboard. It almost sounded convincing at the time that only bbs forwarding traffic should be expedited on the backbones and real time communications be prohibited. But this took away some of the fun for those who may not have hf priveleges and who enjoyed long distance connects.

Then the technology stagnates. The rest of the world keeps on advancing. The landline/rf modems catch up to 1200 baud and greatly surpass that speed. The internet becomes affordable for average people. Now, not only is packet becoming obsolete, but amateur radio is getting some significant competition for potential and existing hams.

Only a few (very few it seems) wanted to take the best of ham radio and the best of the new technologies and do things that were at the leading edge. The majority had no interest in improving the network as the cost would be too high for the packet users to upgrade their equipment. (Hi speed packet, meant 9k6 in our area).

Also, there were a few (very few, but very vocal) extremists who felt that interconnecting the landline/rf internet network with the ham rf network was totally unacceptable. Similar to those who opposed new advances in amateur radio at every step of the way. There was no critical mass in most areas. The packet system declined. Even traffic handlers, did not adopt new technologies to help the tragically ineffective NTS. Ironically, it is not uncommon for traffic handlers to use long distance telephone to deliver traffic to the final destination. This is due to the lack of traffic handlers at every community. Sometimes, when all else fails, it is even

mailed.

Remember, that the internet is not just wire interconnects. There are fiber, satellite, and now other rf links.

In order to attract new digital hams, I believe that we need very high speed rf links for the local community. It is not possible to have even medium speed links between many communities much less all over the country/world. So you can either use internet ties, or have a few slow speed links here and there and force people (such as all of you who are reading this message) to migrate more and more to the useable mode, the internet.

The choices really are:

1) Meld the internet and ham radio

2) Use the internet as the replacement and that includes eventual end user rf connections. (Doing nothing is the same thing as number 2).

Rick, KV9U

What planet did you say you have been on the last ten years, Jim?

> The
>guys who did much if not most of the work in setting up nodes etc. were
>interested in BBS operation which resulted in a packet network

That's right. If not for those guys, there would literally have never been a global digital RF net.

They did the work, they donated their time and money, they spent many a late hour getting hardware and software to behave itself properly. That's right, Jim... They built the packet net.

All that time, there was also an Amateur TCPIP community, but they did - Nothing.

>that not
>only was dominated by BBS forwarding and TCP/IP header exchanges but
>truly frustrated the new "Joe Ham" packet user who tried to log on and
>use the "system".

Let's see... The Node/BBS folks were the only ones who got off their cans and actually DID anything, and you see the fact that their BBS's existed as some sort of terrible imposition.

Gee, you and your TCPIP buddies could have gotten off of YOUR asses, and spent YOUR money, and donated YOUR time, but as we all know, the Amateur TCPIP community did - Nothing.

>I think it was a mistake to belittle and discourage
>keyboard-to-keyboard packet usage since the great majority of HAMS
>enjoyed that (in the few places where they could find other keyboarders
>to communicate with) MUCH more than logging on to BBS's.

I've know quite a few BBS SYSOPs, and have attended meetings where twenty or more of them were all in the same place at the same time on several occasions. At no time have I EVER heard a fellow SYSOP belittle keyboard-to-keyboard communications. In fact, most BBS SYSOPs I know are hard-core keyboarders.

In my area, there are currently a dozen or so Hams who regularly chat via good old fashioned Keyboard QSO's. Of that number, four are BBS SYSOPS and four more are Node-Ops.
That's two-thirds of the active Keyboarders in my area. I'm part of that, but only a couple of days out of the week. Most of the best Keyboard QSO's happen after 10:30 at night, and a lot of times I'm asleep by then.

>For several years, during the packet explosion and during it's rapid

Look at who was "teaching" them... The guy who shows no respect for the people who BUILT the packet network.
I'm not surprised at the reactions you got.

>I saw NONE who were interested in the LEAST in
>BBS connections and use thereof. BTW, this was BEFORE the internet
>explosion.

But AFTER being exposed to your ignorance, and having it represented to them as "knowlege".

If a Bozo like Jim had introduced me to Packet Radio, I'd probably have had enough sense to spot him for what he is, and ignore his blatherings. Not everybody can be expected to do that though, which is why Bozos like Jim should never be allowed near new or prospective Hams.. That kind of Jerk will ruin Ham Radio for people before they ever have a chance to find out how much fun it is. - And that appears to be exactly what he did.

>But, in the few occasions where we were able to connect with
>a LIVE "keyboarder" packet op, the interest was unbelievable. The kids
>who were "mike-shy" really were excited about keyboard communication,

>reasons.

No need to "preach to the choir", OM. Most experienced Packet ops know all about "Keyboard QSO's" , as I was taught to call them long ago. I'm glad you're all excited about it, but you're going to have to get past this idea that Keyboard QSO's are your personal discovery. All of those legitimate packet networkers you despise have been doing it since day one.

Somebody told you that BBS SYSOPs are "down" on Keyboard QSO's, and being a LandLine Lid, you lapped up that bit of negativity like a puppy with both his front paws in a bowl of gravy. It never occured to you to check out the accuracy of what you had been told... After all, A "LandLine Lid" told you, so it MUST be true, right? -- That's what is known as "intellectual bankruptcy".

Maybe you should consider a career as a TV evangelist... You'd be driving a cadillac in no time flat. Why not pursue a career you are intellectually suited to? You only have to work one day out of the week, and there's nothing good on TV then anyway. Think it over, Jim!

>My point is that packet radio "powers" quickly became enamored by
>automated forwarding and BBS domination and at worst tried to belittle
>or discourage "keyboarders" who might otherwise have turned into packet
>supporters and movers and shakers.

Total horse-hockey. There are and have always been Keyborders who have contributed to the Packet network. There's one in particular who I am thinking of who recently put up two ROSE nodes and a KA-node in my area. This month!) He doesn't operate a BBS, and hardly ever looks at a BBS unless he's looking for bargains on used equipment. That doesn't keep him from being a vital part of the network.
This ham, by the way, has recieved nothing but support (along with appreciation and respect) from myself and the other BBS SYSOPs and NodeOps in this area.

That's because instead of running his mouth and being a negative Jerk like you, OM, he got off his can and CONTRIBUTED something to his fellow hams. Something over and above the "hot air" and "vapor projects" the Amateur TCPIP community typically offers.

I doubt seriously that You even KNOW anybody who has ever put in thousands of dollars and hours into providing RF-based networking and services for their fellow hams. It's pretty obvious that you have absolutely no clue of what you are talking about, and are having to work from the bottom of a deep well of ignorance.

The reason the "movers and shakers" were and are so enamored by BBS forwarding is because it WORKS, as a way for Hams to reliably communicate using RADIO, on a global basis RIGHT NOW.

Amateur TCPIP never offered that much in the past, and it doesn't offer that much now.

>This was kinda hard to happen since
>9 out of 10 (or maybe 98 out of 100) new users of packet radio gave up
>in disgust within a month or so after trying their new TNC the first
>time.

Another good indication, Jim, that you should stay away from new packet ops. It appears that your attitudes are pure poison, OM, to have 98 percent of your students quit in disgust within a month or so. That's the very worst turnover rate I have ever heard of, by far.
I can assure you, OM, that when more competent and knowlegable Hams work with new Amateurs, they leave out all of the ignorant negativity and hostility toward the Packet Net you have displayed here, and GUESS WHAT? Those new hams DO NOT give up in disgust within 30 days...

What did you do to digust and dissapoint those new Hams so much? Tell them they would get "free Internet access"? That's the lie most commonly told to prospective Packet ops by LandLine Lids, and when the new guys find out the truth, yes they do tend to be disgusted.

Certainly on airliners, I'd expect the PIC to say a definite no as the hamradio equipment would not be certified for this aeroplane. I have worked a Varig 737 captain on his way from Amazonas State to Recife and I would guess that his airline had no objections and he didn't see any side effects of operating his rig on board, you'd expect it to be less suttle than a walkman.
I've seen nothing in UK Air Law to say that you can't operate hamradio equipment on board and If I felt it desireable, I'd take my radio with me, keeping an eye out for any peculiar readings while operating. There are many private pilots both in the UK and the USA who operate /AM, so I guess no laws are being transgressed. It would be a strange set of laws, one which says you can operate /AM and another which says you can't.

I have a complete Hoka Code 3 demodulator for sale. I've only used it a few times. I will ship it in its original box with all documentation and sales receipts for $300 to anywhere in the CONUS (firm.)

This demodulator was purchased for $595, and nails most "esoteric" as well as the common digital comms. The WEFAX is particularly good. I recommend a tight, well-filtered receiver for its use.
Thanks,
Brad, NB9M

>networks.

He did? Well, if that's true then you must feel really let down when you
read the ignorant crud he has been pushing lately on this reflector. Having
read his recent posting, I'm amazed to hear that at one time he made some
really good comments. I'm glad to hear it, though.

Has he suffered a head injury since then, perhaps? ;-)

>When the packet network was initially being set up, it was a real
>interesting challenge to see how to interconnect the various nodes and
>routes. Like you usually see in this type of activity you have those of us
>who really enjoyed the technical part and also the practical part.

Yes, and those "various nodes and routes" existed because of the BBS SYSOPs
and NodeOps who got off their asses and donated their time, money and in
some cases much more, in order to provide a service to their fellow hams. -
Whether those fellow hams had enough intelligence and common decency to
appreciate their efforts or not.
If BBS SYSOPs and NodeOps "did it" for the recognition and respect they got,
there never would have been a packet net. No, those Hams were true
philanthropists, giving of themselves to all of their fellow hams, and their
community. None of them "did it" for pay, and the ones who "did it" for
recognition and ego bloatification soon moved on to greener pastures. I KNOW
a good number of BBS SYSOPs, and NodeOps, and I know what kind of men end up
sticking with it on a long-term basis.

In other words, if it had been left up to whining, ingrateful guys like
you, Rick, there would never have been a Packet network to enjoy (or
disparage) in the first place.

>Unfortunately, there are the power freaks who see this as the latest way to

>Needless to say, the "new" ham did not set up a bbs.

Thank goodness! The last thing a "new Ham" should be thinking of is taking
on something as advanced as operating a Packet BBS or Node. It's most
definitely not a "new Ham" sort of project to take on, as both require
considerable experience and enough confidence in your ability and knowledge

to be able to cooperate with others effectively.
A lot of Hams complain about BBS's and Nodes which operate intermittently, or have their parameters set up in an incompatible way, or who refuse to cooperate with other stations. Most of these are set up and operated by inexperienced hams who were not ready to take on that level of responsibility, but who think running a BBS or Node is "neat" and figure they have a "right" to run one, whether they do it properly, or cooperate with the rest of the Packet community or not.

When I became interested in running a BBS, I spent a few months studying packet a little deeper than usual, then I spent more time getting to know a few BBS SYSOPs, then I spent a few more weeks learning the basics of the software, routing, ect. By the time my BBS was on the air, it was because I had been INVITED to participate.
Those other SYSOPs were not only my "Elmers", but they were "forwarding partners" as well. I was invited not only because of what I knew, but also because I displayed a willingness to learn and cooperate. I showed respect for what they did, and for what I intended to do.

I didn't just "decide" to run a BBS whether it was needed or wanted or not, and without bothering to learn something and getting to know a few of the people I would be working with first. I also did not try to tell the more experienced hams how things should be done. Instead, I expressed interest in how THEY did things. Maybe that's why nobody was "livid" when I decided to set up my BBS.

At first, I didn't give the "networking" end of things much thought, beyond my responsibilities as a BBS SYSOP. After a while though, I discovered that the Networking part was where the challenge in Amateur Packet Radio could really be found. Running a BBS is Ok, but it's not nearly as challenging as trying to figure out how to get packet access between A and B. The BBS's, Clusters, and other servers tend to drive such efforts by creating a need for a certain level of throughput, but all that does is "create the need". You still have to do the hard part, such as finding a site for the Node, financing it, and coordinating your efforts with other NodeOps who may be "local" in packet radio terms, but still are a two or three hour drive away by automobile, and who are generally just as busy and hard to get together with as you are. We all have families, lives, ect.
Getting the equipment together and working is only half of the merry-go-round, maybe not even that. That's the easy, fun part.

>At first the technology does something that is not available elsewhere for
>an affordable price to the average person.

And it still does.

>But as the network bogs down with
>more and more bbs messages, the power structure prohibits the use of the
>long distance real time interconnect of keyboard to keyboard.

The funny part about this is the source of the BBS message glut Rick refers to.

Prior to the existence of Internet Gateways and Internet Forwarding of Amateur Packet Radio messages, the "system" only had a small number of "@WW" bulletins to move, and was quite capable of handling that load. There was a bit of overloading, but nothing like today. There was just enough to stimulate growth.

Then a few Internet Forwarders set up their Non-Ham stations and lo and behold! The number of @WW bulletins grew by several orders of magnitude, literally overnight.. At this point, over 80 percent of all bulletins I receive are addressed @WW.
Remember what happened to AOL, when they suddenly offered unlimited Internet access and they ended up with lots of new customers, while ALL customers naturally tended to stay online much longer than before?
(Lots of BUSY signals from AOL)
Gee, I wonder why the Ham Radio (RF) net can't handle the @WW bulletin load anymore? Gee, did you ever wonder why so much of the @WW stuff is lengthy, trivial junk these days, that hardly anybody bothers to look at? Gee, I wonder why the Packet net doesn't PERFORM as well as it used to?
What brought on this decline?

That glut is a direct result of Internet Forwarding. Shut down the LandLine Lids, like they have done in most of Europe, and you will begin to discover just how impressive Amateur Packet Radio can be.

Think about it. The LandLine Lid BBS message glut also has a lot to do with the VHF/UHF nets being overloaded. The BBS operators and NodeOps aren't the only ones suffering because of the irresponsible actions of Internet Forwarders.
Keyboarders can also thank those same idiots for choking up our VHF/UHF networks with tons of unwanted crud, making it difficult to maintain a decent QSO over any significant distance.
Prior to Internet Forwarding and the @WW glut it brought down upon us all, I remember being able to QSO at least briefly for over 500 miles, over ** NetRom ** nodes. Now it's hard to do the same over the much faster TexNet network at times.

There is a growing community of BBS SYSOPs now who routinely Zap any messages which have not traveled the entire distance by means of Amateur Radio. Yep, they are killing bulletins which have gone through Internet Forwarders, in an effort to re-establish a genuine, functioning Amateur Packet Radio network. I have not joined in with those guys, but maybe someday I will. If I do, I bet I'll end up Zapping an awful lot of @WW bulletins, and you do not pass on, display or forward what you Zap.

Now you know why. Check it out for yourself. The bulletin glut is the direct result of the introduction of Non-Ham links into an Amateur Packet Radio network. Your Internet Forwarder buddies are directly responsible for most of what you are here complaining about. Your complaint is legitimate, but your blame is misplaced, Rick.

Look to your LandLine Lid buddies if you are wanting to see who screwed things up here in the U.S..

>It almost
>sounded convincing at the time that only bbs forwarding traffic should be
>expedited on the backbones and real time communications be prohibited. But
>this took away some of the fun for those who may not have hf privileges and
>who enjoyed long distance connects.

I have had contact with individual packet ops and organizations all over the world, and I have yet to hear of any suggestion that keyboarders be "shut out" of any segment of already existing network, except for TexNet backbone links which BBS ops are "shut out" from as well.
(If you have a 9600 bd backbone, it will work great as long as you only allow 1200 bd access.) Only TexNet nodes access TexNet backbone links, and rightly so.
the "load" presented by Keyboarders is negligible.

There are instances where what Rick describes goes on, I'm sure, though I've never seen it. I doubt seriously though, that keyboarders are being "locked out" of existing network so that BBS's could "take over". There are, however, many instances where BBS SYSOPs set up nodes and links specifically for BBS forwarding, so as to cut down on the load presented to the "regular" network. In those cases, yes they may not appreciate having those backbone links invaded.
In the 440 MHz BBS forwarding net in my area, nobody cares if a Keyboarder goes through there or not.
Because.....
As noted above, many if not most BBS SYSOPs and NodeOps are keyboarders as well. I guess that's because it's fun. I can tell you with firm authority that if the Internet Forwarders shut down and the @WW traffic once again fit the system it is intended for, the BBS operators and NodeOps would be out there breathing just as big a sigh of relief as the keyboard-only folks would be doing. Everybody would be a lot happier, except the Internet Forwarders, I suppose.

>Then the technology stagnates. The rest of the world keeps on advancing.

Exactly... There are just a few places on this planet where Internet Forwarding is illegal, and those laws are enforced.
Those few places with no Internet Forwarding and "wormholes" are also by some strange coincidence the only places where the Packet network has grown and advanced in an uninterrupted fashion over the last decade.

We have Internet Forwarding, LandLine Lids and stagnant technology....

They have no Internet Forwarding, no LandLine Lids, but they do have advanced
Amateur Packet Radio networking, with typical connects over a dozen nodes or more with turn-around times of just a few seconds. Some of the FlexNet nodes in Europe, Rick, routinely handle over 10 MegaBytes an HOUR. (10MB/hr.)

Good, old fashioned AX25 Packet Radio networking, developed instead of undercut, disparaged, and sabotaged. Gee, I wonder if those Hams in Europe envy us in the US for our Internet Forwarding stations?
I'll venture a bet that most of them don't. ;-)

>The
>landline/rf modems catch up to 1200 baud and greatly surpass that speed.
>The internet becomes affordable for average people. Now, not only is packet
>becoming obsolete, but amateur radio is getting some significant
>competition for potential and existing hams.

It's all for the best, Rick. If negative, whining guys such as yourself make up the bulk of the "exodus", as all evidence suggests, then Amateur Radio can only benefit from such an enema.

I'm looking forward to that day. We Hams, you understand, would like to get back to Amateur Radio and let the Non-Ham types go on to do what they do best, where they do it best. Somewhere outside the Amateur Radio community, where they will be less of a drag on Ham Radio, and Amateur Radio won't be such a drag on them.

>Only a few (very few it seems) wanted to take the best of ham radio and the
>best of the new technologies and do things that were at the leading edge.

...And even fewer displayed an ability or desire to work with others, or to learn anything significant about the systems they proposed to "replace".

>The majority had no interest in improving the network as the cost would be
>too high for the packet users to upgrade their equipment. (Hi speed packet,
>meant 9k6 in our area).

Yes, that's right. I have provided 9.6kb access on my node on several occasions. After a few months with no users, I shut it down in disgust. On the other hand, there's a bright side to that situation... If a 9.6kb backbone will handle a dozen users with 1.2kb access comfortably, think of how many QSO's could simultaneously run over a 56kb backbone with 1.2kb access. You could have four BBS's forwarding during your keyboard QSO over the same backbone, and never see a detectable difference on your end. That's the "bright side" of the current problem with high-speed equipment being too expensive, flakey and complicated for use by "Joe Ham", who comprises the bulk of the Packet net.
Networkers are fewer in number, more likely to spend money on equipment, and are not dismayed by complicated, flakey equipment... Instead, they develop a love/hate relationship with the offending piece of junk, sometimes spending more night-time hours with it than they do with their wives.

>Also, there were a few (very few, but very vocal) extremists who felt that
>interconnecting the landline/rf internet network with the ham rf network
>was totally unacceptable.

I suppose that if you insulate yourself from the general Packet Radio community, then isolate yourself with a bunch of LandLine Lids, then within that context I'm sure your statement above is completely true. - Otherwise, it's a load of baloney.

If you had talked to the Packet Networkers who have had their nodes "routed around" by LandLine Lids, or HF forwarders who had suffered the same, or Keyboarders who are disgusted at the BBS bulletin glut, you might have gotten a different response. In other words, maybe you should have been

talking with the Hams instead of the Lids whose attitudes brought on most of our present difficulties in the first place.

>Similar to those who opposed new advances in amateur
>radio at every step of the way.

Oh boy... Another guy who sees Non-Ham communications as a "great advance" for Amateur Radio... What a dope!

>There was no critical mass in most areas.
>The packet system declined. Even traffic handlers, did not adopt new
>technologies to help the tragically ineffective NTS.

By "new technologies", do you mean "the Internet" ? You actually do, don't you? Boy o Boy...

>Ironically, it is not
>uncommon for traffic handlers to use long distance telephone to deliver
>traffic to the final destination.

That's a lie. Maybe you should participate in an NTS net for a while, and develop a bit of respect along with a bit of knowledge.
You could use a big slug of both of those.

>This is due to the lack of traffic
>handlers at every community. Sometimes, when all else fails, it is even
>mailed.

I've seen that happen, but not much. Very little of NTS travels or ever did travel via Packet though, so really this entire part of the discussion is out in left field a bit.
If you're trying to say that Non-Ham stuff is used to transit NTS messages for the majority, or even a significant fraction of the total distance they are moved, you are a liar, Rick. I know better, because I know traffic handlers and have put in some time at it, myself.

>Remember, that the internet is not just wire interconnects. There are
>fiber, satellite, and now other rf links.

None of which are built, financed, or operated by Hams... Want to know why? Because Hams cannot engage in commercial enterprises, using Amateur Radio frequencies.

It's "Non-Ham", by definition. Get it?

>In order to attract new digital hams, I believe that we need very high
>speed rf links for the local community.

I doubt it. Most new Hams cannot afford high-speed equipment, and those who can are generally not experienced enough to be attracted to running it. You attract new hams by making it easy and inexpensive to get started, not more difficult. That's why I "push" the FlexNet "soundcard TNC" for new packet ops. It's 1.2 or 9.6kb, the PTT interface costs three bucks to make. A transistor, a resistor, and a diode. That's what is attracting a lot of new

packet ops right now, not expensive, difficult, exotic stuff. If you've got a VHF or UHF radio, a computer with a soundcard, and three bucks for parts, you're in business.

Top that.

>It is not possible to have even
>medium speed links between many communities much less all over the
>country/world.

That's right. That's why AS HAMS, we need to be clever enough to look at other solutions besides high-speed for our digital RADIO network.

Read my article on HF Multicast, at my web site for one example...

>So you can either use internet ties, or have a few slow speed
>links here and there and force people (such as all of you who are reading
>this message) to migrate more and more to the useable mode, the internet.

Well, since the Internet ties have been proven, over and over, to have a disruptive and destructive affect on attempts to build and operate an Amateur Radio based network, then the choice for Hams is pretty obvious.

The choice for those "hams" who value Speed more than Ham Radio is obvious, too. By all means, stay right here on the Internet. Sell your Ham equipment, if you have any, and spend the money on better access from your ISP, or perhaps a better modem. The important thing, of course, is to do what appeals to you personally.

I happen to know that the telcos (which I have some upper level contact with) are already offering 56kb spread-spectrum cellular ISP service in a few cities, and that this service will become dramatically cheaper and easier
to get in the next few years. Faster, too... The 56kb SS units are the "early" stuff, the first ones to hit the streets. It's amazing how much they resemble the systems TAPR has not quite got their act together on, yet, and unlike the TAPR SS Radios which use Amateur frequencies, the stuff from the 'phone company is not restricted to non-commercial uses. It's the "real thing", not a third-rate stillborn imitation of Internet access.

Hams who maintain the fantasy of "competition" with the Internet establishment with the resources available to Hams are the real idiots. That's cool though, because it's a fiction which will become harder, not easier to maintain as time goes by.

>The choices really are:
>
>1) Meld the internet and ham radio

A good way to destroy Ham Radio in a hurry, and give up ALL of our spectrum real fast.

You don't work for one of those corporations which stand to benefit when Hams lose spectrum by any chance, do you? Just wondering what might

motivate your position in this matter...

>2) Use the internet as the replacement and that includes eventual end user
>rf connections. (Doing nothing is the same thing as number 2).

Sorry, but "eventual" is already here. And as usual, the Amateur TCPIP
community has done - Nothing.

I have *never* worried about what LandLine Lids would actually DO... I worry
a lot more about the work of their betters which they delight in UN-DOING.

That appears to be their major talent.

>which is the equivalent of BBS ops on Packet.

When the GRAPES network was slow, we asked BBS sysops to restrict
forwarding to the period between 12mid and 6am so that other traffic,
primarily keyboard to keyboard in those days, would have a fighting chance
of using the network. Of course that slowed down BBS message forwarding,
so the BBS sysops weren't too happy about it, but they went along.

The real bandwidth waster, however, turned out to be what we called BBS Dxing.
That's connecting to every distant BBS you can and reading bulletins on it.
Every newbie seemed to do it. Of course if they'd just wait for a forwarding
cycle, the bulletins would appear on their local BBS, but they didn't seem
to get that idea. The solution to that was to go back to full time forwarding
between the BBS stations. That made BBS Dxing less interesting since
you'd find virtually the same bulletins on every BBS. But keyboarders saw
much more congestion during their normal operating hours.

So we broke up into LANs (really should be called MANs), each on its own
frequency, and served by its own BBS. BBS forwarding used the backbone, no
forwarding took place on the LAN frequency, so keyboarders once again got
a break. But the digi Dxers were unhappy because they couldn't go 8 hops out
anymore without changing to the backbone frequency, where they had to compete

with the BBS forwarding. And because stations were hopping from frequency to frequency, no real routing systems could be maintained so the network could locate a station.

This latter thing was a serious problem. Any sensible network should do routing automatically. The user shouldn't have to worry about that. And any network routing protocol should be flexible enough to use alternate routes based on the current status of the network, IE links up or down (fault tolerance), congested links (dynamic routing), etc. So we replaced the digis with network switches.Now a user could stay put on his LAN frequency yet be reachable by any other station, and could reach any other station, no matter where in the network that other station might live. The network could handle the routing (naturally we used IP routers since they are ideally suited to this purpose, IP having been designed by the military to be both fault tolerant and dynamic).

To deal with issues of backwards compatibility, I wrote an extension to the IP code which allowed it to work as a multiport digipeater for those not yet running TCP/IP on their home stations. They didn't get the benefit of automatic network routing, but at least they could traverse the network while staying on their LAN frequency where they belonged. Later that was obsoleted when Netrom emulation was included in the switch code.

That worked, but with backbone congestion, it didn't always work very well. It was obvious we needed more backbone capacity in order to serve all the varied usages people wanted out of the network. That's when Dale came along with the 56 kb RF modem (1986). We started installing them on backbone links. That speeded things up wonderfully. Problems with network congestion virtually disappeared for a while.

But performance for the user was still poor because he was sharing a LAN frequency with others, including those reading the BBS, at 1200 baud. That's frankly awful when there are a hundred or more stations trying to use one LAN frequency. So we created high speed LANs where the user ran at 56 kb. That worked great for a while too. It still works fairly well intra-LAN. But as inter-LAN traffic picked up, the backbone started being congested again.

So we reorganized the backbone, which had originally been a single frequency half duplex (like the old old 145.01 MHz days). We started installing duplex links between switches, and assigned different frequency pairs to each link in an area to avoid collisions. That worked really really well, and that's where we still are at the moment. But as user activity continues to pick up on the LAN side, still more backbone capacity will become necessary. The next step is to upgrade the backbone to 1.2 Mb full duplex links. Eventually we'll have 1.2 Mb user LANs as well, and the cycle will begin again.

If this sounds a lot like what has happened with the wired internet, it should. We had to deal with the same sorts of issues as the wired world has had to address. As our network became more in demand, and as more services became available, we found ourselves on that

never ending treadmill of trying to keep capacity up to meet demand.
But that's Ok, that's what we do as networkers.

>Besides, based on ten years of observation, I found that there was not
>nearly the prolonged interest in "real time" comms as you suggest.
>Oh, sure, it's fun for a while, but eventually folks discover that if
>you want to chat, it's a whole lot easier to just pick up the mike and
>do it on two meter FM. They found that leaving messages on BBSs and
>mailboxes was far more efficient for packet than live chat, even when
>there was NO forwarding going on. We have CHAT mode enabled on all
>our user nodes, and after the novelty wore off, they got no use at
>all.

Certainly when all you have is 1200 baud, the thrill of keyboarding
quickly pales for most people, and picking up the microphone and
talking is generally a better alternative. It is when you want to talk
beyond the range of a voice repeater, or when you want to send
pictures, drawings, or binary files, that the network has the advantage,
if it is fast enough. It must be fast enough, or the user loses interest.

With our current setup and traffic load, it is possible to use white
board conferencing software to communicate with someone in a
LAN several hops down the backbone in something approaching
realtime. That's useful. If the network isn't too busy, it is even
possible to use a chat program to do digital voice over that sort
of distance. Though frankly use of HF voice coupled with white
board conferencing over the network is better. But not all of our
users have licenses permitting access to suitable HF voice
spectrum.

>>My point is that packet radio "powers" quickly became enamored by
>>automated forwarding and BBS
>
>That's because store and forward messaging and bulletins was by far
>the most efficient use of the original low-speed network. In most
>areas, it never got improved enough to get past that point.

Store and forward messaging, now called email, is a definite strong
point of packet. Because it is non-realtime, it is useful for staying in
touch with someone who doesn't share your operating hours. But
the BBS as the method of handling email is somewhat obsolete.
Direct host to host smtp is generally much better, offering confirmed
delivery, and the ability to read and respond offline. It is less demanding
on network resources too. Of course the BBS remains the fallback
for those not running network aware software in their home stations,
or those who for some reason don't leave their packet stations on
24x7. That's becoming increasingly rare in our area, however, and
BBS stations are serving less and less of a purpose. Some of our
LANs no longer have their own BBS. Instead, a single multiuser BBS
on the backbone serves several LANs.

That's practical because BBS usage is way down from what it was
in the early days. Much of the bulletin traffic now comes here to the
usenet instead of to packet, and most email is handled host to host
by smtp. We did have a nntp server up for a while to handle bulletins
in a newsgroup format, but it never became very popular, so the
fellow running it shut it down. I've talked up the idea of a broadcast
bulletin server, but haven't found anyone else wanting to do it.

Radio is inherently a broadcast medium, and would serve well as
a way of broadly disseminating bulletins to the user community
without having each station log onto a BBS and download the
same bulletins as every other user. *That's* a serious waste
of bandwidth. A broadcast server can send bulletins once,
and everyone copies them at the same time. That's much more
conservative of network capacity. But there doesn't seem to be
much interest in that.

Bulletin traffic is one area where the usenet has really siphoned
activity from packet. Instead of reading and sending packet bulletins,
people get on the usenet newsgroups instead. It gives worldwide
distribution in near realtime, something we can't yet do with packet
radio (and probably never will given the realities of doing large scale
distribution across the necessarily sparse amateur networks, current
HF distribution seems to take days instead of minutes, and doesn't
have the capacity we need anyway). I expect we'll see less and less
BBS bulletin activity on packet in the future.

More and more, packet is a realtime activity among network aware
hosts. With sufficient network speed, that's an exciting and very
useful way to operate. It allows us to do things which are awkward
or expensive to do on the wired networks. In that vein, the fifty
automated Wx stations we're setting up for ARES are ideally
suited to packet radio. Using radio means we don't have to have
a phone line at each station (and we can even use solar power
if convenient backed up mains power isn't available). We can site
the stations where they provide the most value as weather stations
rather than having to consider the logistics of the wired world.

We could do this at 1200 baud, but ARES wants near realtime (actually
it is the agency they service who wants near realtime), and that means rapid
polling. Some of the stations will also have web cams for a near realtime
look at sky conditions. (Recent tornados have made it plain that realtime
"ground truth" info is vital, doppler radar alone isn't good enough.) This is
an ambitious project, and one that wouldn't be possible without a strong
fast fault tolerant network infrastructure to support it.

FYI.....

The FCC regulations are:

S 97.11 Stations aboard ships or aircraft.

(a) The installation and operation of an amateur station on a ship or aircraft must be approved by the master of the ship or pilot in command of the aircraft.

(b) The station must be separate from and independent of all other radio apparatus installed on the ship or aircraft, except a common antenna may be shared with a voluntary ship radio installation. The station's transmissions must not cause interference to any other apparatus installed on the ship or aircraft.

(c) The station must not constitute a hazard to the safety of life or property. For a station aboard an aircraft, the apparatus shall not be operated while the aircraft is operating under Instrument Flight Rules, as defined by the FAA, unless the station has been found to comply with all applicable FAA Rules.

The FAA regulation (FARs) are:

Sec. 91.21 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person may operate, nor may any operator or pilot in command of an aircraft allow the operation of, any portable electronic device on any of the following U.S.-registered civil aircraft:

(1) Aircraft operated by a holder of an air carrier operating certificate or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.

(b) Paragraph (a) of this section does not apply to--

(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator

of the aircraft has determined will not cause interference with the navigation or communication system of the aircraft on which it is to be used.

(c) In the case of an aircraft operated by a holder of an air carrier operating certificate or an operating certificate, the determination required by paragraph (b)(5) of this section shall be made by that operator of the aircraft on which the particular device is to be used. In the case of other aircraft, the determination may be made by the pilot in command or other operator of the aircraft.

I am having trouble getting up on Rtty. I'm using an MFJ1278, FT990, 500 HZ filter and XPCOM software All I get is garbage. I've tried changing baud rate, switching to ASCII, changing from LSB to USB, nothing helps. I occasionally get something that makes sense when the signal is VERY strong. 30% of it is still garbage, but I can tell there is a QSO going on.

What am I doing wrong? What is the standard convention, 45 baud LSB, right? Is it the MFJ? What is everybody else using on RTTY ?

Thanks
keith

Huh, you're sure it's rtty. Sounds like deedle-eeedle-eeedleeedle and not breeep, breeeep, breeep, right? Me, I wouldn't mess with a narrow filter like 500hz until I had it working right. Do you know if it's W1AW -- if so, what time are you listening? When I hear a loud RTTY signal it's usually that -- especially during weekdays.

Just about all schematics work! Look at any of the following URLs:

http://home2.swipnet.se/~w-23257/projects/hamcom/hamcom.htm
http://www.accessone.com/~tmayhan/
http://www.asiaonline.net.hk/~webpage/kitfai/ham/hamcomm.pdf
http://www.pervisell.com/ham/hc1.htm

If you are interested in trying digital modes, give a thought to Hellschreiber, which is receiving a lot of attention among the digital "in crowd", because, although invented way back in 1927, is one of few modes that lend themselves to true eye and brain human-read text (as opposed to computer read). The other obvious example is (ear and brain) CW. Hell works very well under marginal band conditions, such as weak signals, serious fading, splatter and QRM that would cripple RTTY. Goes a treat over 500 - 1000 mile paths on 80m late at night when even SSB is a trial.

There is some very simple software for Hell by LA0BX using a Hamcomm interface, which works really well - provided you keep the audio level low enough that noise barely prints. Check out these references:

http://www.netup.no/~clank/hell/hr_la0bx.html
http://home.c2i.net/clank/ham/hell/hell.html

These sites may not be easy to access from the US (they work fine from the rest of the world - only the US is behind the times!), so if you have trouble, send me an email at as149@detroit.freenet.org and I'll send you the software.

Just off the top of my head, I can recall good software for Hamcomm interface for:

RTTY (Hamcomm)
AMTOR (Hamcomm)
Pactor RX (Hamcomm)
FAX (PC HFFAX)
SSTV (Pasokon TV Lite or EZYSSTV)
Weather satellites (PC GOES WEFAX, requires an extra demod and remod)
Spectrum analyser (BMKMULTY, Hamcomm and others)
Hellschreiber (LA0BX)
MOSAIC II (ZL1BPU - me)

The MOSAIC II software is currently transmit only and is still in development. MOSAIC II is a frequency domain (multiple sequential tones) version of Feld-Hell, and is narrow band (200 Hz) and very noise immune. It requires a good waterfall plotting program for reception, such as GRAM 4.2.2a.

Let me know if I can help further.

Murray ZL1BPU

All of the HamComm-style interfaces are basically the same, although
some designs include audio filtering in an attempt to boost performance.
There is a scanner-related site that has an excellent pictoral diagram
of the receive section of the circuit. It uses common components on a
Radio Shack project board. You can check it out at:
http://web2.airmail.net/lblant1/trunked/trunker/RXLAYOUT.GIF

I have also found an alternate circuit for receive that uses a transistor:
http://www.geocities.com/SiliconValley/Lab/1067/QDIF.JPG
They also have a web page for interface assembly at:
http://www.geocities.com/SiliconValley/Lab/1067/ALLINONE.HTM

For information and amusement.

Does anyone have the month/year reference to the QST article that described the results of the membership survey, or the month/year reference to the board of directors decision to leave the status quo? I must have missed something!

Here's the cut/paste from the W1AW bulletin. I'm sure it will cause some discussion...

Gary W2CS

SB QST @ ARL $ARLB052
ARLB052 ARRL Proposes Simplified Amateur License Structure

ZCZC AG52
QST de W1AW
ARRL Bulletin 52 ARLB052
>From ARRL Headquarters
Newington CT July 20, 1998
To all radio amateurs

SB QST ARL ARLB052
ARLB052 ARRL Proposes Simplified Amateur License Structure

The ARRL Board has agreed to propose a simplified Amateur Radio licensing structure with four classes. Lengthy discussion and debate during the Board's meeting July 16-18 led to majority support for a plan for four written examination elements to establish amateurs' operational and technical qualifications instead of the present five, and two Morse code examination elements instead of the present three.

Under the plan adopted by the Board, the entry level to Amateur Radio would be known as Class D and would convey the privileges of the present Technician license. The written examination would be at the same level of difficulty as that of the present Technician examination, but consistent with the privileges of the license. All amateurs now licensed as Technicians would become Class D.

The next step would be known as Class C and would convey the privileges of the present General license, but with phone subbands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. Class C would be the entry level to high frequency (HF) operating

privileges. To upgrade from Class D to Class C, an amateur would pass a written examination on the operational and technical qualifications required for HF operation and a 5 word per minute Morse code examination. All amateurs now licensed as General, Technician Plus, and Novice would become Class C. The expansion of the telephony sub-bands would result from ''refarming'' of the Novice CW bands that are no longer required for their original purpose.

The third step would be known as Class B and would convey the privileges of the present Advanced license, but with phone subands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. To upgrade from Class C to Class B, an amateur would pass a more advanced written examination similar in difficulty to the present Element 4A and a 12 word per minute Morse code examination. All amateurs now licensed as Advanced would become Class B.

The final step would be known as Class A and would convey the full privileges of the present Amateur Extra Class, with telephony sub-bands expanded by 50 kHz on 75 and 15 meters and by 25 kHz on 40 meters. To upgrade from Class B to Class A, an amateur would be required to pass the most difficult written examination in the sequence. Consistent with the practice in many other countries, no additional Morse code examination would be required beyond 12 words per minute. All amateurs presently licensed as Amateur Extra Class would become Class A.

In their discussions, Board members emphasized that the objective is to rationalize and simplify the amateur licensing structure without reducing the requirements for any class of license. Where reductions in Morse code requirements are proposed, there would be a corresponding increase in written examination standards. On the other hand, Board members were adamant that simplifying the structure should not come at the expense of privileges already earned by amateurs. Therefore, present Novice and Technician Plus licensees, having earned entry-level HF operating privileges, would be granted the new entry-level HF license.

Adoption of the simplification plan marks the culmination of 30 months of work by the Board, during which time the input of literally thousands of ARRL members and other amateurs and prospective amateurs was considered. The Board debated a wide variety of options including both smaller and larger numbers of license classes, higher and lower qualification levels, and different privileges. Nine of the 15 Directors voted in favor of the plan, with six opposed. Following the meeting ARRL President Rod Stafford, W6ROD, observed, ''The debate was at times contentious and the result was not unanimous. Some Board members preferred greater simplification; others were uncomfortable with some of the changes being proposed. However, every Board member, without exception, left the meeting knowing that each of his or her colleagues did what they believe is best for the future of Amateur Radio.''

Members are urged to contact their ARRL directors to comment on this proposal. E-mail addresses are on page 10 of any issue of QST. Members also may comment on the proposal via the ARRLWeb site, http://www.arrl.org or via e-mail at restruxarrl.org.

BECAUSE the FCC is about to announce a Rule Making Proposal to change
to only 3 (three) license classes and only one cw testing speed (5 wpm
to satisfy treaty obligations). Expect this in about one month. The
ARRL is only trying to react and keep 4 classes and two cw testing
speeds (5 and 12wpm) and to look like they (ARRL) is leading US
Amateur Radio.

Since i've been wery pleased with the "Analyzer2000" for plain CW i
wondered if there are anything out there for decoding RTTY like PacTor,
AmTor, Sitor, FEC, Navtex etc
????
Not things like HamComm 3.x or BTL or other things, NO it must be something
that runs perfect under win95 AND is a 100% windows-program. It must also
be able to decode via the soundcard and automaticly see what the
hardware-settings are.

I paid 98$ for the A2000 and i can pay the same or more for RTTY-dec's as
well !!!
(Only receiving preferred)

Anybody know where to get an FTP Software driver (TSR) or substitute with documentation for interfacing a 3COM Etherlink III 3c589 PCMCIA card to JNOS via the ATTACH PACKET interface?

Thanks Ken kwick@mitre.org

Is W4SCO privy to inside FCC sources the rest of the world isn't?
This claim needs some real verification.

> >

Somebody is as full of shit as a Christmas Turkey !!

I is NOT illegal to use ham radio from an airplane. I am a pilot and have had a dual band in my
plane for years.
Also the rule for needing a licensee for aircraft band has been scraped for flights inside the US.

International overwater flight ARE REQUIRED to make position reports on HF radios. This is done on LSB and USB.

FM is used everyday for news, police, business, traffic and ham operators from airplanes.
Search and rescue can be on air band or FM, as needed.

Someone needs to study some rules before getting on group and saying ham radio and FM is illegal from airplanes

That is an ultra-cool project. I'm very interested in keeping up with your work on it.. Perhaps even helping out. As for your query: I advise that you look into the Linux (try http://sunsite.unc.edu/pub/Linux) kernel code if you haven't already. It supports AX.25, TCP/IP, and everything else you can imagine in any combination you can conceive.

A cellphone won't work too far off shore, or in anyplace too far from a "cellsite". You'd need to use satellite, and if you think cellular is expensive, wait till you see the rates for satphones! http://www.thegpsstore.com/ sells one made by Magellan if you're interested in looking.

You can most likely change the addresses and IRQ's used by your serial ports. If your computer is older, you may need to change jumpers on the motherboard or on a card. If you have a newer computer, you can probably change the settings via your BIOS setup screen.

I'm sure the facts vary from place to place. In this neck of the
woods it WAS the BBS sysops who installed the initial nodes. Save for
one sysop, there always is that "one", forwarding during prime time
was avoided. Problem here is that may newcomers come on demanding to
be able to do things their way. It's true that a system can be built
to serve the needs of all interests, but cooperation is hard to come
by...

right?
>Is it the MFJ? What is everybody else using on RTTY ?

I assume that you've learned to tune in a signal properly with the MFJ 1278, which despite the display and MFJ propaganda takes some learning.

First, I suggest trying to tune without the 500 Hz filter in line and seeing if you can decode what you hear. Second, if you have a later 1278, try the command ASA on a signal, and see what baud /rate it suggests. It's not perfect but it can give you some idea of what you're getting. Third after you get the signal tuned in, then switch in the 500 Hz Filter. Fourth, RTTY is not as common as it used to be. Most of the digital HF signals I hear except on W1AW are pactor or GTOR, or PACTOR II (The 1278 won't decode either PACTOR II or GTOR). Also during rtty contests, you'll find what seems like millions of stations running RTTY. I learned to properly tune my 1278 during a rtty contest that I didn't even bother to enter.

It's pretty tough to impossible to get permission as a passenger these
days. But I do talk to a ton of airline pilots talking themselves. But
they use their built in hf rigs that they use for long distance. So
really should be no problem as the radio in that case is tested and I
assume certified to be safe to use. I have used one myself on a lear 35.
Great radios they have. The one I used was a collins gen coverage
digital rig mounted behind the F/O 's seat. Had fantastic audio coming
from the 2 speakers built in to the ceiling. Also auto tune on key up.
Most of the big jets using simular setups. Really nice, If you can get a
chance at them. But usually only the pilots will get that chance unless
you know one ect. MK

The only problem with this is that in the U.S. it's illegal to use the aircraft's comm radio, antennas, or other equipment for amateur operations. Even with the pilot and owners permission you must use separate equipment.

TCM3105 are still available in Europe in large quantities, see at
infracom@avo.net (or http://web.avo.net/infracom) for example.
Shippement to the USA is not expensive at all for small quantities.

does it work on hf packet/amtor/pactor ?
your correct lsb and 45 baud is common with narrow shift.
have you checked the mark and space frequencies - 170hz apart.
my pk232 has both wide and narrow.
AA7QA mike

Question: Is this what FlexNet is doing with Win95, when it allows use of native Win95/98 tcpip applications and servers such as NetScape, Eudora, FTP, ect. with either AX25 or tcpip packet radio? Is the TNC "seen" by Win95 as a regular network device in that case?

From what I understand, Linux and WinNT versions of FlexNet are in the works.. Until then, maybe you could get by with Win95, for this kind of action. There are a number of tcpip server programs available for Win95/98, so it wouldn't just be browsers, e-mail and ftp... You could get (fairly) serious.

If you are interested in looking into FlexNet, there are links and info at my URL below. Just push the "FlexNet" button, and go from there.

FlexNet appears to be a virtual device driver under 95, from your description and what I can gather from the flexnet page, and is similar to a Linux kernel AX25 drivers, in theory of operation (not actual construction). In unix, running the Linux kernel drivers, not TNOS, its similar to a network card driver in that it packages everything in AX25 UI frames, then passing them onto the next layer, which is either a KISS driver or a hardware driver for a packet card. It strips AX25 off when it receives packets, passing them back up to the appropriate bound protocol layer. You can bind other higher level protocols that AX25 UI can support to it, though I am clueless on whether or not it knows about other protocols other than TCPIP, I guess I could review the code. I'm not sure if flexnet for windows is that versatile, as I haven't played with it (though it looks to be a better way to get and give packets). I think there is also a sockets API for AX25 under Linux.

It would be very neat if polling support in Flexnet were added to the AX25 driver in Linux. I'm not sure whether a whole Flexnet program would be beneficial as it seems that flexnet would have to work much like TNOS under Linux, as an entity that Linux plugs into for network services. It would be better to offer a flexnet driver that replaces the AX25 driver, and fits in with the general scheme of allowing the kernel to maintain total control over network devices.

Try the 3COM web site. Their driver disks should have a packet driver
for the 3c589.

The FCC is what is pushing the ARRL to act now before the FCC puts out
its rule making proposal to drop code exams to just 5 wpm. I expect
the FCC to act fast on this and might expect to see it take effect
early next year, if not sooner, especially now that the ARRL supports
the idea. You might want to plan on getting an HF rig for Christmas!!

Also the regulations state that the operator makes that determination.

Sec. 91.21 Portable electronic devices.

(a) Except as provided in paragraph (b) of this section, no person may
operate, nor may any operator or pilot in command of an aircraft allow the
operation of, any portable electronic device on any of the following U.S.-
registered civil aircraft:
(1) Aircraft operated by a holder of an air carrier operating certificate
or an operating certificate; or
(2) Any other aircraft while it is operated under IFR.
(b) Paragraph (a) of this section does not apply to--
(1) Portable voice recorders;
(2) Hearing aids;
(3) Heart pacemakers;
(4) Electric shavers; or
(5) Any other portable electronic device that the operator of the aircraft
has determined will not cause interference with the navigation or
communication system of the aircraft on which it is to be used.
(c) In the case of an aircraft operated by a holder of an air carrier
operating certificate or an operating certificate, the determination required
by paragraph (b)(5) of this section shall be made by that operator of the
aircraft on which the particular device is to be used. In the case of other
aircraft, the determination may be made by the pilot in command or other
operator of the aircraft.

"Operate," with respect to aircraft, means use, cause to use or authorize
to use aircraft, for the purpose (except as provided in Sec. 91.13 of this
chapter) of air navigation including the piloting of aircraft, with or
without the right of legal control (as owner, lessee, or otherwise).

Thanks to all that have responded. I might have bitten off more than I can chew but my current goals are:

1. Construct a "Network Interface" driver for the PalmPilot to allow it to use its TCP/IP stack over a KISS TNC.
2. Construct a NDIS NIC driver for Windows95/NT to allow people to use the TCP/IP stack in windows 95 to talk to a TNC via KISS mode.
3. Construct a driver for Windows CE 2.0 machines.

Right now I am waiting for the 3com Developers support team to get back to me about some specifications on the developers kit that were left out. They reference you to a section of the manual for more information, and the section doesn't exists. This is my main hang up right now, I already have most of the Ax.25 packet handling routines done.

My basic goals are to develop a uniform interface for the platforms to allow programming of emergency management software.

I am talking with someone about giving me some webspace on a server, once I get some space I am going to be setting up a WebPages about the project.

You might also want to check out...
ftp://hydra.carleton.ca/pub/hamradio/packet/tcpip/ethrax25/

Ethrax25 is a packet driver that looks like an ethernet card to
Windows, but communicates with a TNC running in KISS mode,
allowing you to use the internal tcp/ip stack over packet.

From the README file for AWZnode:

AWZnode is based upon LinuxNode by Tomi Manninen OH2BNS
and FlexNode by Roy PE1RJA. It was born initially for the aripisa.ampr.org
system by Stefano Noferi IZ5AWZ of ARI Ham Radio Association of Pisa
(ITALY).
Users in AWZNode can connect all ham packet world:
all AX25, NETROM, ROSE, FLEXNET, TCP/IP nodes in the world are now near.
I have a packet dream: all the packet networks can interchange
connections.
My version of node software for Linux is an attempt to realize this idea
and I hope it can help the ham radio digital world to come back one.

I haven't tried it with flexnet or rose (nobody to talk to), but the
other features all work (and it's compatible with glibc).

Bob

Two existing very good packages here - Flexnet and AGW Packet Engine.
Check out:
http://dl0td.afthd.th-darmstadt.de/~flexnet/
and
http://www.forthnet.gr/sv2agw/start.htm

They both allow the connection of SCC cards, sound cards, Baycom, YAM
and oe5dxl modems as well as (expensive) TNCs

You will find someone has beaten you to it by nearly a year or so...

My primary goal at this point is the connectivity for the PalmPilot units, but my goals with the Windows95 and NT machines are slightly different than the two packages you mention. Both applications use a type of emulator or EXE that runs in memory. They both allow you to use the native tcp/ip stacks in windows to communicate via TCP/IP over AX.25 but I am going about it a little differently. And am going for a different level of connectivity.
I am looking at constructing a AX.25 TDI layer for Windows 95, this would allow the AX.25 layer to be installed just like any other network protocol in windows 95. As well as developing a NDIS 4.0 compatible network driver for talking to KISS TNC's. I have a very large document that outlines specs, function calls etc... and don't want to bore everyone with the details here. But the main goals of the Windows 95 driver project:

- Being able to interface to AX.25 by using standard Winsock calls in windows 95/98/NT.
- Being able to interface to TCP/IP over AX.25 with standard Winsock calls
- Separating the AX.25 layer from the interface driver. Allowing you to run Ax.25 over any standard network driver in windows 95.
- Make example source code for TNC Driver freely available to allow others to construct TNC network drivers for Windows

I don't have my binder here in front of me, so I don't have my complete SDP in front of me. But I am trying to make a TNC into a standard network device on windows, so it can easily be programmed and developed. I want to make it possible for people to develop graphical interfaces to packet BBB's, or custom software that can be guaranteed to run on almost any TNC in the same manner without having to worry about the specifics of the TNC.

It Might sound like a pipe dream, but I have written device drivers for NT is the past, so it is in the realm of my expertise. My main problem right now has been getting enough time to work on the projects as there are really 3 separate projects and I still have a real job that pays the bills.

Lee,

How much are you prepared to spend?

The best controller, IMHO, is the SCS PTC-II. It offers all the common digital modes and also Pactor 2. The latter mode is used by several stations that provide Internet email access - for free.

The PTC-II does cost a fair bit, but if you start looking at the per message cost for commercial services, it pays for itself pretty fast.

As I mentioned, they ARE AVAILABLE at magazine stands. Go to your library, many keep subscriptions to those. Find some local amateur radio ops, they are usually interested in techie stuff. Maybe will even give you their back issues.

If none of this works, I am sure that a search engine would give you several hits if you typed in something like rtty.

good luck!

The Kantronics KAM Plus is pretty bulletproof and offers most of the commonly used digital information modes. The MFJ probably has more modes but seems to have lots of reports of erratic performance ... not what you want on the high seas!

>This is, of course, the most ironic aspect of this "conversation".

...Or the most "idiotic" (and that's saying a lot.)

I would venture a guess that I have much stronger connections within the telco industry than anyone else on this reflector. The suggestion that I "hate telephones" is particularly moronic, but then again, "particularly moronic" is what I have come to expect from Jim, KH2D and his LandLine Lid buddies.

Remember that Jim is an original member of the "LandLine Lid List", which goes far in explaining his position. Yes, "Jim-Boy" is one of the Bozos who helped bring on the @WW bulletin glut, which in turn brought on the decline in Packet Radio in the USA... All so his BBS would have a bigger "message count" and he could really feel he had "accomplished" something. What a loser.
Yes, Jim is personally responsible for destroying Packet Radio on his home, the island of Guam, and directly contributes every day to the further decline of Packet Radio in the USA.

I'm sure all the other LandLine Lids on the reflector think he's a real great guy, and just chock-full of "wisdom".

Ok, these are obsolete versions of linux on CD.
They work, and you can get bill gates off your computer
without downloading forever or spending $50 somewhere else.

Turn the flamethrower off and head over to www.ebay.com,
where I've listed these under auction "Computers: Software: General"
with a minimum bid of $3, which just covers 1st class mail these days.
You do not need a cc number to bid at ebay. Its free to buyers.

Here is exactly what I have:
redhat 4.2, with boot floppies and no manual, www.ebay.com item #22725098
slackware AUG95, with manual, www.ebay.com item #22725808 (includes DOOM)
slackware APR96, with manual, www.ebay.com item #22726680

Please don't email me directly about these. They aren't worth much, and
I just want to get rid of them in an interesting way...
go to www.ebay.com to bid. auction ends by 7/28 10:something am PDT.

Kantronics 9600 baud packet station, complete.
* Kantronics D4-10 XTAL based data radio, 19.2k capable (list $259+ modems)
* Kantronics Data Engine with 1200 and 9600/19k2 modems (obsolete, old list $400)

Stuff is for auction at www.ebay.com, which is really easy to use.
The item number is 22765160, or you may search for it under
Listings->Consumer Electronics->Radio Equipment

The opening bid is $8, which just covers my shipping cost.
I'm moving to Hong Kong, so this must go.
It worked great the last time I used it in 1994!!!

Auction closes on Mon 7/28 so let the bidding begin! www.ebay.com is free for buyers, and does NOT require a creditcard to register.

Please, no bids via email, use www.ebay.com to bid.

You might consider just giving them away. There's an effort going on
now to get those old Linux CD's into the hands of people who can use
them. The idea being that someone can try out Linux without cost, get
hooked, and spread the word. I know locally there's a second attempt
at trying to bring a "freenet" to town, and they keep looking for
people who can deal with Linux/Unix. Trying to propagate Linux in
the first place might be a better means of creating people interested
in the project who can handle the operating system, in effect infect them
with it, than by trying to get "experts" who might not necessarily be
interested in the project.

Anyway, there's a webpage devoted to this Linux initiative at
Linkname: Linux CD and Support Giveaway
URL: http://visar.csustan.edu:8000/giveaway.html

People looking for Linux disks to get started, or have old Linux CD's
that they want to get into the hands of people who can use them might
want to check out the page. Or simply do the same thing on a local
level, using a local newsgroup.

Frankly, I'm confused about what you are trying to do. Unless you don't have a phone line to your home, anything you can do through radio links (except mobile computing, of course) can be done better through the phone system:

phone lines are faster. (56kb v. 9.6kb)
phone lines are more secure. (less subject to interference and eavesdropping)
there would be no question of illegality by using amateur frequencies for business.
-or-
you won't have to design a one-of-a-kind system that *you* would have to maintain.
even if the phone line is a constant expense, it should also be more reliable.
Lastly, even though this is not an all inclusive list, I think that your cost constraints are too low.

However, if you decide to continue with the radio links, you can reduce costs by building antennas, buying used gear and doing as much of the work as you can by yourself (or with friends). Either way, hope you can get what you want.

He has The first 1.0 RedHat release and the last a.out Slackware, cheap,
for people interested in that sort of thing. [1]

For people new to Linux, you can get a good distro cheap from any of
these places:

www.cheapbytes.com
www.linuxmall.com
www.lsl.com
www.linuxcentral.com

Note that you need a credit card to buy Linux cheap from one of these
places. If you do not have a credit card, you can get RedHat 4.2 at ebay,
which is still in use in many places, since it is more stable than the 5.x
RedHat, and is still supported by RedHat.

- Sam

[1] a.out compresses better for people making floppy-based distros. Also,
the shared libraries are a little faster, since you get an extra
register.

3361. SSTV RTTY CW on Sound card

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-26 00:00:00 UTC
From: The2x4 <the2x4@bellsouth.net>
Message-ID: <OsEu1.8645$PT1.3771425@news2.atl.bellsouth.net>
Source record: 22945

Recently there was a program
listed here for SSTV and other modes.

Anyone remember the name or site for a
download?

It was for WIN95 and not BTL or HAMCOM.

Source record: 22947

Does anyone know what is the most recent version of MFJ's Multicom (windows) software for the 1278?

Is there any other software package that can be used for SSTV with the 1278 WITHOUT modifications to the 1278?

Thanks,

Duffy - WB8NUT

It doesn't work! At all! No video output, nothing but a scream from the buzzer while the power switch is on... Can't get it to stop buzzing at me, and I'm not sure about what is supposed to be inside. Anyone have any experience inside of these things, or have a repair manual? PS voltages would be nice, as well as what I should look for at the test posts sticking up out of the circuit board...

"Charles Brabham" <n5pvl@texoma.net> wrote:

>Remember that Jim is an original member of the "LandLine Lid List", which
>goes far in explaining his position.

And, remember, also, that Charlie is the one that invented the landline lid list. But let us look at this as an opportunity. We have presented before us, a chance to once and for all establish the fact that Charlie has exactly zero credibility.

Charlie, the self appointed expert on the subject of the non existant 'global packet network' sez:

>Yes, "Jim-Boy" is one of the Bozos who helped bring on the @WW bulletin
>glut, which in turn brought on the decline in Packet Radio in the USA...

But Jim sez: Not so, Charlie. Even when the BBS here DID forward mail, years ago, via satellite and HF, on the satellite bulletins were not excepted to be forwarded, only personal mail, and on HF I never forwarded ANYTHING addressed to @WW. Had I done so, on HF, I'm sure that it would meet with your approval, because there is no question in my mind that 300 baud packet on HF really blows your dress up.The 'BBS' here now is nothing more than a front end for the DX cluster.

If the deciding factor on the U.S. packet network 'working' or 'failing' is one DX cluster with a JNOS front end in Guam, 7000+ miles away from the U.S., then you have other things to worry about besides me.

So Charles, please produce, from your packet archives, anything that I forwarded to anywhere addressed to @WW over the phone. Matter of fact, please produce, from your archives, anything that I forwarded to ANYWHERE, over the phone.

I know, don't tell us, you can't.

Your memory is a faulty as your facts. You seem to forget that when we had a 'discussion' a while back, it was about DX clusters and internet connections, not mail forwarding. That's how I got on your 'Landline Lid List'.

Which leaves me to believe that since you placed me on your 'landline lid list', you did so soley based on the fact that I don't agree with your usual doctorine of packet baloney, and which also leaves me to believe that the following statement, about 'other landline lids' is an indication that in your travels as a packet preacher, you have met a few other people who don't agree with you either. You placed me on your list because years ago I tried to have a civil discussion with you,

which isn't possible, based on the fact that I don't agree with what
you preach.

And now you are here, and juvenile enuff to think that anything you
say that harms my credibility helps yours. In some peoples mind,
it might - if it was FACT. But you just make things up as you go
about me, so I'm inclined to believe you do that about anyone who
doesn't agree with you.

>I'm sure all the other LandLine Lids on the reflector think he's a real
>great guy, and just chock-full of "wisdom".

I am taking the time to type this message for one reason, Charlie. What
you, or anybody else who uses this newsgroup thinks of me is not the
reason. I pay my own rent. I am typing it for your benefit.

You seem to be missing the point about why we are here, Charlie. This
newsgroup is called 'rec.radio.amateur.digital.misc', and is a forum for
us to discuss things which are digital that have to do with amateur
radio. It's not a forum for you and I to run a personality contest and see
who likes which of us the most. As I said previously, it doesn't matter
to me who 'likes' me or who doesn't. I am interested in the digital aspects
of ham radio, that's why I'm here. I imagine a lot of others are interested
and are here for the same reason. You, on the other hand, seem to think
that your packet network will funtion better if everyone believes your
balony and thinks you are a swell guy.

On occasions, you have lapsed into a semi-normal state and posted some
useful information here about Flexnet and maybe a few other things. And
if you notice, nobody complained for a minute about anything useful you
posted. I think you are a swell guy when you do that, I don't attack you.
But unfortunatly, you always lapse back to the Land Line Lid baloney.

If you want to preach the gospel of 300 baud, and downfall of the world
based on your views, go do it somewhere where the audience will appreciate
it, Charlie. Go start another newsgroup - charlie.sez.telephones.suck or
whatever.

Nobody listened to you when you preached via packet radio. Nobody cares
to listen to you preach here. Either become a useful, constructive user of
this newsgroup, or go over to .policy or .misc where everyone likes to
argue and preach.

Figure out a way to present your opinions without personally attacking anyone
with differing opinions, and you might even win a few followers.

Arguing with me, and making up stories about who did what or who didn't
do what is only a waste of both of our time, and a waste of all the other
peoples time who have to wade thru this baloney to see if anything posted
here is really about 'rec.radio.amateur.digital.misc'.

Source record: 22955

Bill,

The Tripmate by DeLorme is being used successfully by some. I have 3 here that I am getting ready to interface to KPC-3 Plus's. If you can find them on sale, you can pick them up for around $120. Normal pricing is around $150. Both of these prices are way below what you would pay for just about any other portable unit with a display, etc.

A couple of advantages of the Tripmate besides price is that it is a 12 channel, parallel receiver with built-in active antenna. It can be powered internally with AA batteries, or through the cable from the serial connector. I plan to power mine from the KPC-3, and mount a small-to-medium size magnet on the bottom of the unit. I will also do something (RTV?) to "weather proof" the unit.

Many other folks have used all kinds of hand-held and some OEM board receivers in their projects. I also have a Garmin GPS-45 XL that uses a BNC connector for the original attached antenna. I have picked up an active antenna for it along with a data/power cable from Lowe Electronics over in Great Britain. They work great! Their homepage is at: http://www.lowe.co.uk/

You should also check at the TAPR APRS page, if you haven't already. Their main homepage is at:
http://www.tapr.org/ , you should be able to find the APRS page from there.

Hope this has been of some help.

73,

Mark

> It doesn't work!

Now it does... After reseating some of the IC's(hmm... I haven't seen many 2732 EPROMs) it seems to work OK. I think I'll take them all out and clean the entire thing out real good and maybe replace those old sockets. Maybe that horrible jittering on the display will go away eventually... And like everything else, the keyboards ALWAYS need cleaning. WAY too many typos on that thing. Can't wait to hook it up to a radio...

> >but seems to have lots of reports of erratic performance ... not what you
> >want on the high seas!

Just had to comment:
I've used a 1278 for years and its been really great. It's MUCH better than
the
KAM Plus in use at the club station. In general, my humble opinion, Kantronics

TNC's are great on Packet but SUCK in any other mode.
On a ship I'd make sure I'm able to receive Navtex (for warnings/weather),
FAX (for weather maps), FEC/SITOR for news and Pactor for the rest.
So for HF: try AEA PK-232 or MFJ-1278. For VHF/UHF I'd use Kantronics
9612.

73's !

Here in comp.os.linux.misc, pjbhk@my-dejanews.com <pjbhk@my-dejanews.com>
spake unto us, saying:

>Wow! I just checked out cheapbytes.com for the first time.
>I wonder what the difference is between the $2 RH 5.1 CD and the $33 set,
>and what Redhat themselves sell for $50. Is it the marketing channel, or is
>there an actual difference.....

The official version sold at Cheapbytes or LSL is the same as the one sold
by Red Hat. The difference is that buying from Red Hat gives them more $$
(which some might see as a good thing).

The differences between the official version and the GPL'd version are:

* A paperback book describing the installation process and answering some
fairly common questions (the FAQ in the back of the book is useful).

* A registered copy of BRU2000-PE (console and X backup program).

* A registered copy of the RealPlayer/RealAudio client and server.

* A boot diskette.

* A CD-ROM full of demo versions of some nice Linux commercial software.

* A very pretty blue box. :-)

3381. Packet Radio historical data

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-28 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6pkpr2$i06@enews2.newsguy.com>
Source record: 22965

Hello!

I am putting together some infomation related to the history of the Packet Radio network, and would appreciate any help I can get.

Roughly five or six years ago, the @WW bulletins here in the USA comprised a minor percentage of the overall load of forwarded bulletins. The great bulk of bulletin traffic in the USA at that point were @ALLUS bulletins.

Perhaps a few of you remember the debates about the "@ALLUS Glut", at that time.

Then, literally "overnight", the load of @WW bulletins increased by several orders of magnitude, then rapidly did so again. Today, and for the last several years, @WW bulls have comprised over 80% of the total messages forwarded in the USA.

The average size of these @WW bulletins also grew to several times that of other distributions, such as @ALLUS for example.

This all happened within a short period of time, perhaps a month or two, and marks the date when:

A: The USA Packet Radio network began it's decline.

B: The first "Internet Forwarders" set up operation in the USA.

Here in Texas, it is well-known that the Internet Forwarding station in Houston operated by Remi, F6CNB first brought the "@WW bulletin glut" down on Texas Hams, causing our TexNet network to suddenly become overloaded, degrading it's performance.

I am interested in the Names and callsigns of the other "pioneer" Internet Forwarders who were responsible for the "@WW bulletin glut", from which the Packet Radio Network here in the USA has never recovered.

Please provide any background and historical information you can, along with the names and callsigns. If possible, provide info needed for verification of the info you offer. - It will be checked for accuracy, and info that cannot be confirmed will not be included in the report.

Do not hesitate to offer unconfirmed information, because it may lead to other info which can be confirmed. Many of the more experienced Packet ops remember the events described... Any assistance and information will be greatly appreciated.

Thank you.

Help is one thing you definitly need !! We'd ALL appreciate it if you go
get some !!

>I am interested in the Names and callsigns of the other "pioneer" Internet
>Forwarders who were responsible for the "@WW bulletin glut", from which the
>Packet Radio Network here in the USA has never recovered.

You are probably the ONLY one who is interested !! If you can't find
any, just make some up !! You're good at that !!

>Please provide any background and historical information you can, along with
>the names and callsigns. If possible, provide info needed for verification
>of the info you offer. - It will be checked for accuracy, and info that
>cannot be confirmed will not be included in the report.

Translation: If you are bored enuff to have saved and packet bulletins
from years ago, dig them out. Charlie will look at the message headers.
Most packet bulletins have more headers than message anyway. Since
most people were using Fumbly Bumbly Bumbly BBS software, no telling
what the headers will say. Since anyone else anywhere along a 'path'
could have edited the headers, if Charlie can't find what he needs, he'll
do likewise.

When the CIA reads 'the report' will they make us all go back to 300 baud ?

>Do not hesitate to offer unconfirmed information, because it may lead to
>other info which can be confirmed. Many of the more experienced Packet
>ops remember the events described... Any assistance and information will be
>greatly appreciated.

Translation: If you don't have any facts, make some up. Charlie needs all
the assistance he can get. If you can't make up any facts, give Charlie some
fiction. He'll run it around the room at 300 baud and turn it into facts. He's
good at that.

>Thank you.

You're quite welcome !!

Lee,

Here's a partial quote from their webpage about the antenna:

The device shown above consists of a very efficient antenna, correctly polarised for the satellite signals. It is enclosed in a weather resistant plastic housing with fixing magnets in its' base, together with a high gain low noise active preamplifier (full performance specs shown below). The preamp is powered by a 5v DC supply fed via the coax cable from the GPS receiver. The antenna and electronics are totally sealed against water, and every unit is immersed in water and pressure tested to 30 Kg/sq cm. It comes complete with 5 metres of cable and a BNC connector.

Me again... Please note the part about the preamplifier. When I use this antenna, nearly all of the 8 signal strength segments on my Garmin GPS-45 XL go to the max indication! The ones that don't are almost always the birds near the horizon, or are partially blocked by buildings, etc. You should try yours out!

Would someone share some first hand knowledge if they know that a Creative Labs Sound Blaster PCI64 will work properly, if at all, in a 486dx100, with Win95, 32 megs of RAM and PCI slots. Will it process Beezely's RITTY software flawlessly, ie. can all RITTY features be used, as designed, if no other window is opened? I realize that my machine is archaic and low on horsepower and a Pentium would be better, and will be, but I wanna use what I have until I own a new Gee Whizz! II Special, this Fall.

Steve,

According to the review in the February 1998 issue of QST, page 68,
RITTY 2.0 works with most sound cards for RTTY, but requires the
genuine article, i.e. a real Creative Labs Soundblaster for PACTOR.
That somewhat limits your choice a bit. You might drop Brian a note
at k6sti@n2.net to see if your final choice would be acceptable.

To add on to this, does anyone know if any laptops have "real
Creative Labs Soundlblaster" card equivalents?

I've dug around the web, and haven't found anything useful.

I hate to bring this up here, but it's relevant, I think.

I'd hate to see the ex-Novice segments go to 'phone operation. What
I'd like to see is them used for low-power operation, with a CW-only
segment and the rest non-phone, usful for low-power digital operation.
Is this a reasonable thing?

And what definition of low-power is useful? I think less than 50
watts, but maybe less than 10 would be interesting.

14.233 is also popular in the US for SSTV, and European stations (HA9RG
et al.)
tell me that somewhat higher frequencies like 14.235 are heavily used
there.

For general fax frequencies, check out Marius Rensen's web site. I
forget the
URL offhand, but a search on Rensen and Fax or RTTY should turn it up.

Gareth, the satgate system on UO-22 was very efficient at forwarding personal mail, but it wasn't designed for bulletins and bulletins were not allowed as traffic thru satgate stations. There were some people who did forward bulletins on some of the other digital satellites, but it was frowned on by the other users. As for HF, we did forward bulletins out here in Asia on HF for years, but it wasn't very fast or effiecient, and not much fun to watch because most of it was 300 baud.

Greetings

Attention anyone in the Houston/Texas area.

Some years ago, I worked with a company that supplied Encode
International (later to become US Videotel) with switch/PAD hardware
for their Kiosk Videotex system. This hardware, which was based on
the 64180 (go faster Z80), was used to control the modem access for
these services.

Question is - is any of this hardware still about? If so, I'll release the
4 port KISS only TNC software I've written for it. The hardware can
handle up to 2x64k plus 2x19k2 simultaniously and multiple boards can
be hung together using a 488 IEEE high speed parallel bus to make a
16 port (the max KISS can handle).

If the hardware has not been buried in a hole in the ground, I'd even
be tempted to finish off the IP switch, AX25 and node software
as well :-))

Check out your garage and see if you have one of these 19" rack mount
jobs with the name "MicroScope" on the front - if you have one, it will
probably have 3 boards in it (12 radio ports!!) and interfaces real easy
to Baycom modems as well as g3ruh and similar higher speed modems.

Cheers

Hi Pete, the guy to ask would be Brian. If I recall correctly, I read
somewhere that Soundblaster only is the soundcard to get. Get
Brian's phone number off of one of the magazine adds and give
him a call, or you can find his email address in the Buckmasters
online database. I've known him for years and I'm sure he'll be
glad to help you make the right choice of hardware.

I tried it. The things I tried didnt even work. This is the wrong place
to post a page like yours, but even so, at least wait till it works.

Would it be that either:

a) The World Wide Digital Network was not feeding out of choice

or

b) The World Wide Digital Network was not capable of feeding

the USA with the @WW bulletins generated by fellow hams on radio based
networks around the globe prior to the arrival of LL forwarding ?

> I am interested in the Names and callsigns of the other "pioneer" Internet

I would find it interesting that such a surplus of material to forward
would result in the death of the network. Surely, it would be a lack
of traffic and incentive to upgrade that would stagnate and kill it ?

Why were there no Satgates and HF links bringing in all of the @WW stuff
from other countries before the LL forwarders ?

I thought the UK amateur licence specifically forbade Aeronautical
mobile.
There was an /AM operation from a special flight in a Canberra a couple
of years ago that got special permission, I believe a few people tried
radio while parachuting just to work a loophole they'd found. I might be
out of date in what I remember, but I'd suggest you check a current BR68
before doing anything. I don't believe UK air regs say anything
specifically about amateur radio.

Cheers

News Flash! I didn't even make up the list in the first place, and am involved in ONE callsign being included there. (N5VGC)

N7QDN builds and maintains the LandLine Lid List, and it's simply amazing how many Lids are "big enough" to participate in "Amateur Telephone" and who will go on to lie about their participation when it is pointed out. The LandLine Lid moron on Guam (Jim) is a good example. He does the "crawfish" with vigor, doesn't he?

Those of you with basic reading skills can consult my Web page, where The LandLine List is displayed, along with the proper credits.

It's amusing to see the LandLine Lids squabble as to how and when * I * included them in "my" list.

Pathetic wretches....

I've suggested that the Non-Ham types move on to CB on several occasions,
but I doubt that anybody took the suggestion seriously.

Maybe that's where you guys would be happier though. - And the Hams would be
happy to see the Non-Ham types finally find a home - A place where they can
finally belong.

That's a common misconception among idiots who are desperately trying to "justify" the damage which was done (and is still being done) to the Ham digital net by Non-Ham types who insist on being "part" of the the Amateur Radio Digital Network.

Sit on it and spin.

>Why were there no Satgates and HF links bringing in all of the @WW stuff
>from other countries before the LL forwarders ?

Yep, there sure were. - But prior to the invasion of the network by morons with Non-ham links, the network supported the level of throughput - that the RF network supported on it's own. There was a slight overload, but it served more as an incentive to growth than anything else.

The "Amateur Telephone" morons then went on, though, to flood the RF net with much more data than it could possibly move, and since then they have continued to do so. It's a deliberate attempt to destroy the Packet Net in the US. Right now I am looking at the LandLine Lid "pioneers" and examining their affiliations. It's amazing how many of them hold jobs at companies which would benefit when Hams lose spectrum, and it's amazing how many telcos are eager to assist in efforts to replace independent Amateur Radio digital networking with utter dependence upon their Non-Ham equipment and networking.

By the way, I'd like to thank those of you who are sending me information on this matter. I'd like to hear more from the southeast and southwest coasts, and from the Ks/Mo area.

Thank you!

DOS APRS needs less computer resources. 286 on up will do well.
" can be modified for new features by WB4APR as
they occur to him or are demanded, within the basic design limitations of the
software and computer OS. Some consider it archaic and crude. I still use it.

Win95 is a much more refined product that requires much more computer
horsepower; 486 and Win95 for openers.. Lotsa GEE WHIZZ! features for those
aspects of APRS it specializes in, including georgeous maps and the ability to
use 3rd party mapping data, such as Precision Mapping CD data.

Other versions such as APRS+SA, (uses Delorme's Street Atlas CD map data)
etc. are available.

I suggest a web search for more details. (there's lotsa)

Yes ! I remember the AOL glut - "Welcome to the Information Superhighway -
AOL users, stay to the right !" and all that. The charges laid against AOL
users were that they were unable to drive the software, ignored any pretence
of 'netiquette', and that the majority of postings were of a mind-numbing
nature such as "me too".

The "issue being discussed" is that of the transport of amateur packet mail
items via LL and Radio, not the content of such items. There were never
any complaints about AOLs message transport arrangements being via non-ethical
means AFAIK - perhaps you could enlighten us as to the circumstances ?

> continued to do so. It's a deliberate attempt to destroy the Packet Net in
> the US.

We're getting to the meat of the matter. The RF based network could not
cope with the rate of the traffic it was offered.

I have a similar story in the past from the sysops in this neck of the
woods, many years ago - and it had nothing to do with LL forwarding which
did then not exist.

The sysops that improved their (RF) network links overwhelmed the BBSs with
poorer links such that 'bottlenecks' were created stalling the traffic.

The affected BBS sysops then 'prioritised' traffic - personal mail first,
bulletins by size such that the largest came last, then 7+ binaries at the
end of the queue. On the really bad links, the largest bulletins and 7+

expired after 28 days and never got forwarded - saving the network from collapse.

Is there any reason why a similar policy could not be employed in the US ?

73,

Gareth.

It's amazing how you maintain that building an all amateur radio
packet network with no phone connections , and no internet usage
is something special, yet you can't convince enough hams to put
up the money, time and/or effort to be part of your dream.

Packet works rather well for some things like APRS, passing messages
in emergencies, even passing repetititive messages to multiple
hams in separate locations if all have packet capability, but it
isn't some magic technique which will improve things for all hams.
Most hams aren't interested in how a message or the DXCluster
info gets to them just as long as it does. Your dream of a worldwide
packet HF network passing traffic is just that, a dream that the
internet has made less practical. Times change, and packet as a
mode only has two decades.

If you can convince hams that all rf forwarding on amateur frequencies
is a viable solution, then that will happen. If you can't, well you
can complain about landline lids all you want, but things won't
change. I'm well aware of Flexnet and the other attempts at
using software to replace the TNC with either a simple modem,
or a soundcard, but unless there is some pressing improvement,
most hams won't bother with your dream.

Hi, thanks for reading this question,

I'm looking for people who have experience and knowledge of using NOS (e.g. the JNOS derivative) to connect to wireless LAN adapters. I'm thinking of getting hold of 802.11 compliant devices and using them for high speed TCP/IP (2 MBPS).

What I need to know is, are there packet drivers available that could be used by NOS to access the 802.11 devices. I don't know much about NOS but from what I can deduce from the manuals, it uses AX.25 as a Logical Link Layer service that then carries IP on top? Am I correct?

If so, is it simply a case of getting the wireless LAN packet drivers, configuring NOS using the ATTACH command and pressing go.....?

Any help, hints, tips & experience would be appreciated.

Thanks in advance,

Matt Green G7PFI

If there is a packet driver available, you would load that as a tsr before
running JNOS and then use the 'attach packet' command. It wouldn't use
AX.25 however.

If you operate them under the rules for unlicensed devices you should be
alright, but you might run afoul of ID requirements, if any, if operated
under amateur rules (which might allow for higher power and/or antenna
gain, etc.)

sounds like a non starter to me.

The devices could be made to do the job ok but over a distance of no more than about 100mtrs LOS.

The rules for licensing don't come into it as they are operating in a licence free band and are being used for exactly what they were made for - networking.

The only thing that could be questioned is if you put an external antenna on the device that exceeded the specifications for the band.

For a laugh at work we had a game of network Quake from one building to the other (about 70mtrs) using PCMCIA wireless cards in the laptops which were placed on a chair on the fire escape out side. Worked quite well until a pantechnican lorry pulled up between us.

The best thing you could try would be some of that wirelkess stuff for linking buildings together. You can get ranges of upto 10k LOS with compliant external antenna running at about 5ghz

From: g1yxf@zetnet.co.uk
Message-ID: <35c5345b.5083480@news.zetnet.co.uk>
Source record: 22910

Hi All,

I have a 1993 version of ARESPACK. I just wanted to know if there have been any updated versions or if there is anything similar to it.

I use TSTHOST for most Packet work as well as PaKet 6.1, but need something along the lines of ARESPACK for RAYNET activities.

Any info will be most appreciated.

3427. PacTerm 98 final public beta on the web

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-07-31 00:00:00 UTC
From: Rick Ruhl <ricker_msn@email.msn.com>
Message-ID: <e73oR0Pv9GA.192@upnetnews03>
Source record: 22911

Pacterm 98 Public Beta 3, the final public beta is on the web at http://www.cssincorp.com/pacterm. This is the 1.1 release that supports the Kam 98, and 3 port 9612 TNC from Kantronics.

The public release of Pacterm 98 version 98.08.01 1.1 will be on the web on August 10, 1998, if no major showstoppers are found with this version.

For the current owners of PacTerm 98 version 98.02.01, this is a free upgrade, as promised.

PacTerm 98 is $69.95 and is available from Kantronics or your favorite dealer.

<WILLY-WAVING = ON>

I could tell the story of the 18GHz 8Mbps link between the mainland and
one of the Western Isles that used to fail every 12 hours or so. It was
only when someone got to one of the dishes and looked along the line of
site that he noticed a rather large "boat" (good 'ole Uncle Sam)
swinging
around it's anchor and lying smack across the path on every flood tide!!

<WILLY-WAVING = OFF>

For Hams, the big untapped resource here is the ability to set up and utilize special Web/FTP sites specifically tailored for use and access by Hams getting access via Radio.

You know - Make sure the content is pre-screened, and none of the bandwidth-wasting stuff like graphics are there to slow things down. Make it easy, safe and legal to access these sites via RF.

I'd have WX servers, Callbook, Propagation info, Mods, Swap shops, ect. The usual stuff, and of course any unusual stuff somebody might dream up later.

This is why I don't think Packet/Internet gates should be outlawed, despite thier widespread abuse. I'd like to put a stop to "Internet Forwarding", but that doesn't mean I'm ready to throw the baby out with the bath water.

We can benefit by pulling info out of the Internet, and if we stop being self-centered for a moment and think of our responsibility as Hams, I think we could find many situations where Hams could CONTRIBUTE meaningful info to the Internet. (WX info comes to mind.)

Does anyone know if there are packet drivers available for the Harris PRISM/AMD PCNet 802.11 cards?? if so, where can I get them? I can get NDIS drivers, can I patch an NDIS driver to JNOS?

OK, so I'm right in saying that the AX.25 is only used if I ATTACH a port as a KISS/TNC device, but if I connect to an ethernet or other type device then it uses the ethernet link layer, with its own addressing (48 bit for ethernet)?

Well......there have been experiments in Norway, where, if you use an antenna with gain, and mount it with reasonable elevation, you can connect reliably upto 7-10km and upto 15km with directional antennae and RX pre-amps.

>
>The rules for licensing don't come into it as they are operating in a

Since the band is a shared amateur-ISM, I would be operating under amateur rules, so as to avoid having to maintain the type-regulation compliance.

Dear Martial Arts Enthusiast

I entirely rebuilt my website and just moved it to a new location at http://www.uechi-ryu.org.

First, this is NOT SPAM nor am I advertising a product to sell by this letter. I wish to share good karate techniques, some which took me 30 years to learn.

If I have sent you this email by mistake, type REMOVE in the subject line of your emailer.and I will promptly remove your mane from the mailing list.

Although primarily a Uechi-ryu website, I have substantial experience in a number of other martial arts, specifically the Korean arts, and I write my weekly classes to be beneficial across all fighting systems. I also provide a dojo list and a website link list, which continues to grow. My website also contains other features which may benefit you, so please visit and the first time you do so, send asome email to voice your opinion about my site. Please visit often and read my weekly classes and enjoy.

I would appreciate one initial RSVP of this letter. If you have a martial arts website and would like to exchange links, let me know.
Yours in the martial arts,
-- Allen

P.S. If you have received more than one of these, it is most likely that my mailbox has you listed under more than one email address. Type DUPLICATE to all the ones you wish to have removed. I am taking every precaution to send this only to those I think will be interested in the martial arts and studying from my website.

I might be able to help you on that, a few month ago I made a "relay" box
that is connected to
a COM port of a remote PC running a packet node software.

We are using it to switch-on the ATV transmitter from a remote packet radio
access, in that
case, the first relay activates the transmitter alone (no video modulation)
and the second
relay activates the video signal that modulates the carrier.

It has been very helpful to experiment with the 1,2 Ghz signals, whether a
simple carrier is needed
for narrow band signal analysis or a wide band FM video signal, it is
available from a simple packet
connection to the remote site (which is hosting a packet radio node BTW).

The small piece of software is available for Linux or DOS. Due to the very
different implementation
on the very different OS'es, the Linux version is providing more security
as the relays are switched-
off when the user disconnects the node (intentionnally or not).
The DOS version is leaving each relay "as is" when the user disconnects the
node, though, on
some remote sites running DOS, the sysops have installed a 24 hours timer
that shuts down
the PC every night to allow a "master" reset of the system, in that case
the two relays are
resetted to the "off" position at each power off/on cycle.

This command line functions are launched from an AX25 or TCP/IP connection,
you can set
the proper access control to suit your needs.

If this would be on interest for your application, I could take the time to draw an electrical diagram
of the relay box and somehow package it with the software sources.

From: W6PXM <W6PXM@prodigy.net>
Message-ID: <01bdbee3$c7ab7c40$297d9cd1@compaq>
Source record: 22835

Anyone have experience using a Televideo 965 with a KPC-2 for DX packet? I have one and no matter how I configure it, I get the @ sign in the upper left, and it will not communicate. I know the TNC is OK because it works fine on my computer. I need to free up my computer, so I would like to run the local DX node on the dumb terminal. I have the manual on the terminal, and have done all I can find to do. The terminal was given to me with no idea of its condition.

Appreciate any response

What's curious about it is that I've probably been into packet longer than
Charlie's even been a ham, and I don't recall @WW bulletins EVER
being anywhere close to 80% of the mix.

First he claimed that the so-called "landline lids" were siphoning off
messages and starving the network, and now he's claiming just the
opposite.... that they're trying to overload the network. I for one wish
he'd make up his mind (assuming that he does have one).

Check out www.tapr.org for their new Metcon 2 kit. I built the
Metcon 1 which had 6 inputs that were binary and 6 dry contact
relays on the output side, all controlled or read via packet radio.
TAPR doesn't offer the original model anymore, but are supposed to
be coming out with a new & improved version, Metcon 2.
I used mine to monitor my parents house over winter while they're
gone south and it works great.

3456. Yaesu FT3000M -> Kantronics

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-03 00:00:00 UTC
From: Marco Guttierez <x_void@hotmail.com>
Message-ID: <35C6961B.BD9C9AFC@hotmail.com>
Source record: 22842
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

I recently purchased a Yaesu FT3000M and I'm trying to connect it to the high-speed (9600 baud) port on a Kantronics 9612 Plus. I purchased the optional data cable from Yaesu and tried to follow the pin-outs from the Kantronics and Yaesu manuals. Unfortunately, I can't get the Kantronics to receive (can't even set receive level). I've tested it with a few friends, and I can transmit packets, just not receive. I've checked out the wiring diagrams on packetradio.com, but they don't have the specific diagram for this setup. If anyone knows of a site that has a diagram for this configuration, or has done it before and would be willing to help, I'd appreciate it.

Thank you,
Marco Guttierez

3457. YAM Parts group order?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-03 00:00:00 UTC
From: James Jefferson <jjeffers@deskmedia.com>
Message-ID: <35C693D9.5025@deskmedia.com>
Source record: 22843

Hello everyone - I've been studing the YAM design for a while now, and now that there are linux drivers available, I'm going to build it!

I ran through and did a quick parts check in Jameco's catalog. It seems that the more common parts are available, but even some resistors are not. I'm sure a place like Digi-key or a large parts house would have them, but there are typicaly minimum orders and wierd shipping charges associated... So that leads me to:

Would there be any interest in doing a group order of these things? It would be more convient for the typical builder, because they wouldn't need to order the parts from Italy, as well as locate the parts. I'm not volunteering myself to cordinate such an effort, but, if need be....

Just by doing a rough estimate it seems there couldn't be much more then $5 of discrete components associated with the design - and the PC Board and FPGA are only $21. It seems that if a group got together we could offer a kit for about $35.

It seems that a $35 9600 baud modem would eliminate the typical complaints associated with the expense of 9600 baud packet. That seems to be a step in the right dirrection!

How does this sound to everyone?

-James Jefferson
jjeffers@deskmedia.com
http://www.deskmedia.com/~jjeffers/

For those interested, the YAM information can be found at:
http://www.microlet.com/yam/

Congratulations, Mike ! You said the secret words ! You disagreed
with Charlie, welcome to the Land Line Lid List !

I don't remember much of anything that Charlie talks about, but I'm
out here in the middle of nowhere, not running a hub node of the
real network, like he is. I do remember @WW bulletins, since most
of them were 90% headers or part 6 of a 7 part 7PLUS 'message',
with the other 6 parts missing, most people out here stored them
all in the bit bucket. Maybe we were the guys who starved Charlie,
never thought about that......

3460. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-03 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6q3358$b4g@news.Hawaii.Edu>
Source record: 22931
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

3463. PK-88 Lockup

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-04 00:00:00 UTC
From: MitchA@pssch.ps.ge.com
Message-ID: <6q7q68$pf9$1@nnrp1.dejanews.com>
Source record: 22847

Hi, All:

I've just recently obtained a well-used PK-88 TNC to use on 2m packet. It has lately been exhibiting some strange behavior--upon firing it up, it locks up on the "MULT" function (red LED), instead of behaving normally, which is to say, going to the green "CMD" function and talking to my computer software. I get an error message that says "TNC not responding". You must know that I'm new to VHF packet, coming from the lower HF CW realm. So please, don't be shy about suggesting the obvious. I had someone suggest that I needed to replace the "World Chip". Any thoughts on that? Where would I get a chip, if that is what is wrong?

Thanks and 73

Mitch

The settings are correct except you do not need to invert. Just set your rig
to LSB, TNC to 45 baud 170hz shift and dial in 50.6 mhz. I heard the band was
open last night but I was in school and missed it. Will listen tonight.

3471. PacTerm 98, version 98.08.01 release 1.1 on the web

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-05 00:00:00 UTC
From: Rick Ruhl <ricker_msn@email.msn.com>
Message-ID: <#IR$ivLw9GA.294@upnetnews03>
Source record: 22855

The beta is over and the newest version of Pacterm 98 is on the web at
http://www.cssincorp.com/pacterm

Version 1.1 not only includes support for the KAM 98 and 3 port KPC-9612 but
has many other features including:

Toggle for Morse code and sound ID on packet connect.
User defined sounds for ID.
Right mouse button menus on all windows.
Addition of a chat window on the Command window for ease of sending commands
to the TNC.
GMON function added to toolbar and menu.
User-defined MAXUSER setting on startup.
Invert tones options on "HF non-packet" mode Settings sheet.
User-defined Macro language. For example: {call} DE {mycall} in a macro
will send KF4WGU DE N4GDO if those are the call signs defined in the
settings.
Option to minimize/restore all windows if main window is minized/restored.

Version 1.1 is a free upgrade for owners of Version 98.02.01. Just download
the two update disks and you have the upgrade.... FOR FREE.

PacTerm '98 is still only $69.95 and is available from Kantronics or your
favorite ham dealer.

Right now Im sending this message over a 5 km path from my home to work using
NOS in a pair of PCs at each end , using a pair of ancient Proxim Rangelan
Wireless Ethernet cards with NDIS drivers and packet shims, a pair of 10 db
gain aerials and an obstructed path. (Cards operate in the (900 Mhz ISM band
with an output power of 100 mw.)
Data rate is 256 kbits per sec , which after you allow for the fact that the
link is half duplex gives you a thruput of around 56kbits per sec, just a
shade slower than a ISDN B channel.
Has been working for the last 6 years without missing a beat, occassionally I
have to reboot the PCs.
Ive also used NCR Wavelan cards in the same arrangement , speed is higher
(2Mbits/sec) but the range is shorter, about 2 KMS witj LOS.
The Wireless cards look to NOS exactly like ordinary wired ethernet cards.

cheers

Jim Run and myself were on last night but heard no one. The band was open
about 4:30pm Central time but I was only hearing a couple of stations on FM.
Did not hear any activity on SSB. Called a number of times CQ with no
success. Rus and I were on RTTY about 8:30pm central time and quit about 9pm.
Tonight I have school but should be home about 8:30pm CDT and will fire up the
rig then.

Thanks Maurie for the info,

the cards I'm interested in use an NDIS 2 driver (plus NDIS 3.x for 95/NT).

Could you tell me what the "packet shim" is? How does it work and where can
I get one? Does it interface the NDIS driver to NOS?

How much do the WaveLAN cards cost? They use the Harris PRISM chips which I
want to get my hands on to make a homebrew version.

Even 56kbps throughput is 46 times faster than the 1200 bps that most people
use.

3480. Transverse filters in G3RUH modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-06 00:00:00 UTC
From: Robin Gilks <g8ecj@abmdata.demon.co.uk>
Message-ID: <902426597.25003.0.nnrp-04.9e98fa25@news.demon.co.uk>
Source record: 22864
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet

Greetings

Here is a question most suited to winter rather than summer evenings.

I'm trying to suss out how to emulate the transmit transverse filter used on a g3ruh 9k6 modem. Its implemented as a FIR (lots of dodgy numbers in an EPROM) that drives a DAC to produce the TX waveform in said modem but I want to work it out on-the-fly with the modem I'm working on (loads of mips in the CPU but not enough memory for big lookup tables).

My understanding of how these things work is based on a couple of lines in one of James Millers' papers that describes the TX of UOSAT22 as a shift register feeding a summing amplifier. My interpretation of that is (in hardware terms) as follows:

Data is clocked into a shift register. The bits are fed in parallel into a summing amp with a weight factor (and sign) according to how far it is from the main bit in the middle

bits in the shift register
```
---------------------------------
data in ---> 1 | 2 | 3 | 4 | 5 | 6 | 7 |
--------------------------------- weighting
| | | | | | |
| | | | | | +-------------- -.05
| | | | | +------------------ +.1
| | | | +---------------------- -.2
| | | +------------------------- +1
| | +------------------------------ -.2
| +--------------------------------- +.1
+------------------------------------ -.05
```

This means each weighting factor is summed into the total by a factor of 0, 1 or 2 depending on how many bits are present at that far from the centre.

Does this make sense to anyone and if so, what are/how do I calculate the weighting factors?

Any suggestion or URL's that may assist greatly appreciated (BTW, I've already been through the James Miller archive at amsat.org). I'm looking for practical things here, not masses of maths that I still can't write a (relatively) simple algorithm for.

If I have time this weekend, I'm going to fix some cables to hook my TNC
to my IC-706 so I can try out 6-meter RTTY. I may be on Saturday evening
and/or Sunday afternoon from Central Texas (EM10).

OK , NOS uses what is commonly called the FTP packet driver spec for talking
to Ethernet cards.
This is / was a popular way to provide a generic non proprietary way to allow
a mass of ethernet cards to talk to Vendor written TCPIP stacks.
The most popular and well known collection of packet drivers was written by
Russell Nelson and is commonly known as the Crynwer collection.
NDIS is a Microsoft method of providing TCPIP support for its products ,
started with WIN3.1 , WFWG and now for 16 bit drivers for WIN95 &NT.
Its incompatible with the FTP spec and in my view a lot harder to get going as
well.
A packet shim , is a small TSR which provides a FTP spec packet driver
interface to a vendor written TCPIP stack when only an NDIS ethernet driver is
available.
You also will need a couple of other Microsoft products , a protocol manager,
usually protman.dos , a definition file , usually called protocol.ini and
Netbind.
Its messy to get going but if you only have NDIS its the only way.
Some Wireless Ethernet cards to have FTP spec packet drivers and Wavelan is
one of them.

There are some down sides of using Wavelan.
1/ They are relatively deaf, (you need at least -72 dbm into the card before
it will work.)
2/ The cards have proprietary RF connectors on them which makes connection of
external aerials difficult.
3/ They operate at 2.45 Ghz which means that RF losses in the cable is an
extreme issue.

If you want to go down this road I would suggest that you look at 900 Mhz cards that dont have proprietary connectors and have a better receiver RF sensitivity.
Generally , most decent cards , especially those which use frequency hopping can work reliably down to input levels of -95 dbm .
Unfortunately , they dont seem to be cheap.

The other possible solution that is worth looking at, although whether it would work in the UK , is to buy a pair of Metricom Modems and use LINUX rather than NOS.

cheers
Maurie Daly

I went there and they want USD49.95 for the DOS program. They also say a
Windowsversion is coming.

My question: I already have JVFAX 7.1, can that be used with the KAM+ output?
If so, how do I set up JJVFAX? And what command(s) does the Kantronic program
send to the KAM+?

Hello Leon,

Try renaming autoexec.nos into autoexec.net. NOS is a derivate from the original NET by KA9Q. I do recall the extension is slightly different. Most, but not all, NOS documentation can be used. However, be aware of minor (annoying) differences.
(At least, this is my experience.) I understood that KA9Q net is not anymore actively developed on. Instead you may want to try NOS or other derivates (unless you need source code).

Regards,

Feico

Yep, I heard several openings from the west and southwest. None were very long lived. I havnt heard much FM at all this year. Either I havnt listened much or the openings wernt strong enough to support that. Keep on, keep'in on!

Actually, Net is occasionally updated, although I believe that it's not
aimed more at the GNU compiler to get around some problems.
It does work, and it does have minor differences from JNOS or MFNOS,
but nothing that playing with it, and looking at the list of commands
won't usually cure.

if you want to use the pk-88 as a tracker, i dont think so. as far as
i know, the pk-88 doesnt have the gps command set. also the pk-88 runs
hot and this makes it kind of impractical to enclose it in a tracker
box in the trunk of your car etc.

on the plus side. it should work excellent in your shack hooked up to
your computer running any version of aprs. hope this helps.

Hi ,
I need the right parameters to set 2 tnc linked thanks a digipeter .
In a few words we have 2 stations A and B and C is a digipeter .
A is connected to B via C .
On the channel usual there are about 2-4 station at the same time.
Which are the parameters to optimize the traffic on the channel ??
I need the SLOT,DWAIT,PERSIST ...ecc ecc . to set A,B and C .
Can you help me ???
Thanks in advance ,
Nino

Nope, JVFAX wont work with the KAM+. Different method of outputting the
data.

You'll need to get SuperFax ($49.95), or wait for WeFax 98. WeFax 98 is
going to be $69.95.

1998 ARRL and TAPR Digital Communications Conference
September 25-27, 1998
Chicago, Illinois (minutes from O'Hare Airport)

Web: http://www.tapr.org/dcc

The 1998 ARRL and TAPR Digital Communications Conference will be held September 25-27, 1998, in Chicago, Illinois. This year's conference location is the Holiday Inn Rolling Meadows, just minutes from O'Hare Airport.

Not only is the Digital Communications Conference technically stimulating, it is a weekend of fun for all who have more than a casual interest in any of the ham digital communications modes. This includes APRS operators, digital networks, software writers, modem designers, and digital satellite enthusiasts. The ARRL and TAPR Digital Communications Conference is for all levels of digital operators -- a must conference to attend to become active on a national level. Now, more than ever, amateur radio needs this great meeting of the minds because it is important that we demonstrate a continued need for the frequency allocations we have by pushing forward and documenting our achievements. The ARRL and TAPR Digital Communications Conference is one of the few ways to record our accomplishments and challenge each other to do more.

A Conference for the Beginner, Too

The conference is not just for the digital expert. This year's conference again provides multiple session tracks for beginning, intermediate, and advanced presentations on selected topics in digital communications. Topics will include APRS, satellite communications, TCP/IP, digital radio, Spread Spectrum, and many others. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in these areas.

Symposia and Seminars

In addition to the presentation of papers on Saturday, three symposia/seminars will be held. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those who may have interest in just one symposium or seminar, registration for the conference is not required to

attend these activities. This allows maximum flexibility for those who may want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

The Second APRS National Symposium will be held on Friday and will be moderated by Steve Dimse, K4HG (the developer of javAPRS). It will likely include many APRS software authors, such as Bob Bruninga, WB4APR (the father of APRS), Keith Sproul, WU2Z, Mark Sproul, KB2ICI (the developers of MacAPRS and WinAPRS), Brent Hildebrand, KH2Z (the developer of APRSPLUS), and other nationally-known APRS leaders. Join this group for the afternoon and evening for in-depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon, a half-day seminar titled "Infrastructureless Technologies in Amateur Radio," presented by Don Lemke, WB9MJN, will cover the pros and cons of DDMA (directivity division multiple access, a proposed infrastructureless technique) versus hubbed (cellular style) and other infrastructure dependent techniques, the basic problem of megabaud rate communications into the ham QTH, and some techniques for channel-area acquisition including full duplex/asynchronous versus simplex/synchronous radio/acquisition concepts. This seminar will start late enough on Friday afternoon to allow those flying that day to attend the seminar.

The Sunday morning seminar will be a combination of two different talks that will make one excellent seminar. The first presentation, by Lyle Johnson, WA7GXD, will focus on the upcoming RUDAK digital communications system scheduled to fly on the AMSAT Phase 3D satellite in the near future. Lyle will discuss features, systems design, integration, and experiments. The goal of the presentation is to zero in on the communications capabilities of RUDAK, the performance to be expected from the 153k6 PSK system, the limitations and capacities of the DSP modems, user requirements for receiving RUDAK, requirements for transmitting to RUDAK, and how amateurs can work to make ground operations a reality once the satellite is in operation. Information on how to submit a proposal for experimental time on RUDAK will be presented. The second presentation will be by Tim Shepard, KD1KY, regarding "Packet Radio Networks with Millions or Billions of Stations." This talk will present concepts and materials that make you think about different possibilities of networking in the future. Both Lyle's and Tim's presentations focus on different aspects of future digital communications possibilities.

Third Annual ARRL and TAPR DCC Student Papers Award

The deadline for the third annual ARRL and TAPR Student papers is past, please think about having students submit next year for the travel awards. TAPR and the ARRL especially welcome papers from full-time students to compete

for these student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see the guidelines for more information). Papers co-authored by educators or telecommunications professionals are also eligible for this award as long as a student is the first author. The deadline for receipt of finished student paper manuscript is June 20, 1999. Please note that this deadline is different from the general conference paper submission date. For full details and paper guidelines contact TAPR or browse to http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the conference is not required for publication. The primary purpose of the conference is to communicate ideas and techniques regarding digital communications. Papers written in an informal style are welcome, as well as those written to academic standards. If you know of someone who is doing great things with digital communications, be sure to tell them about this! Papers are due by August 15, 1998, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111, or via e-mail to lweinberg@arrl.org. The paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local/International Co-Host

The 1998 ARRL and TAPR Digital Communications Conference will be co-hosted by Chicago Amateur Packet Radio Association (CAPRA). CAPRA is one of the oldest packet radio groups in the US. It focuses on education about amateur packet radio, coordination of joint efforts of hams interested in packet radio, and technical and equipment support for a sound packet network in the Chicago area. They have had high-speed packet networks operational since the mid-1980s. Visit the CAPRA Web site at http://www.imaxx.net/capra for more information.

PRUG (Packet Radio User Group of Japan) will be the first International co-host of the ARRL and TAPR Digital Communications Conference. The conference is proud to welcome PRUG as part of the conference. PRUG will be hosting an informal social Friday evening after the seminar and symposium are completed. Visit http://www.prug.or.jp for more information about the organization.

What can you expect during the 1998 ARRL and TAPR Digital Communications Conference?

* A full day of papers, breakout sessions, and selected topics on Saturday for the beginner to advanced amateur digital enthusiast.

* Three seminars/symposia
Friday (1 PM)
- Second Annual APRS National Symposium,
moderated by Steve Dimse, K4HG

Friday (3 PM)
- Infrastructure Technologies in Amateur Radio
conducted by Don Lemke, WB9MJN

Sunday (8:30 AM)
- RUDAK Future Operations and Experimentations
by Lyle Johnson, WA7GXD
- Packet Radio Networks with Millions or Billions of Stations
by Tim Shepard, KD1KY

* Third Annual Student Paper Awards.

* TAPR Membership Meeting

* A banquet with special guest speaker Steve Roberts, N4RVE, of Nomadic Research Labs. Creator of the Winnebiko and Behemoth high-tech recumbent bicycles. His current project is focused on Microship technology (http://www.microship.com/).

* SIGs (Special Interest Groups) get-togethers on Saturday, following the banquet

* Informal get-togethers throughout the weekend

* A facility that is perfect for this type of conference

* Informal engineering discussions/demonstration areas

* Motorola Museum located in the area.

* An event at which the most important new developments in amateur digital communications are announced

* Digital 'movers and shakers' from all over the world in attendance

---

Conclusion

If you have attended a Digital Communications Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you have never been to a Digital Communications Conference, then make your plans now to attend and find out how much fun they can be.

There are few activities where your participation can be so much fun and so important! You will be able to get together with colleagues from all over the world and bring each other up to date on your latest work. Experience all this and more for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to

see you at the ARRL and TAPR Digital Communications Conference, September 25-27!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399, phone 940-383-0000, fax 940-566-2544, e-mail tapr@tapr.org, browse www.tapr.org/dcc.

Sincerely,

Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Conference Manager
Mark J. Thompson, WB9QZB, Local Host Liaison
Carl Bergstedt, K9VXW, Local Host Liaison

Note: If you need conference handouts or flyers for ham club meetings, contact TAPR to get what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn Rolling Meadows. Special DCC rooms rates are $85 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC in order to get the discount. It is highly recommended that you book your room prior to arriving. A block of 75 rooms is reserved until August 31, 1998. After the 75 rooms are booked, rooms will only be available in nearby hotels, so be sure to book your rooms early! The hotel provides transportation to and from O'Hare Airport. Please contact the hotel to arrange specific transportation needs.

Holiday Inn Rolling Meadows (conference hotel)
3405 Algonquin Rd
Rolling Meadows, IL 60008

This is a unique opportunity to gain insight into this fast-growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon, a half-day seminar titled "Infrastructureless Technologies in Amateur Radio," presented by Don Lemke, WB9MJN, will cover the pros and cons of DDMA (directivity division multiple access, a proposed infrastructureless technique) versus hubbed (cellular style) and other infrastructure dependent techniques, the basic problem of megabaud rate communications into the ham QTH, and some techniques for channel-area acquisition including full duplex/asynchronous versus simplex/synchronous radio/acquisition concepts. This seminar will start late enough on Friday afternoon to allow those flying that day to attend the seminar.

The Sunday morning seminar will be a combination of two different talks that will make one excellent seminar. The first presentation, by Lyle Johnson, WA7GXD, will focus on the upcoming RUDAK digital communications system scheduled to fly on the AMSAT Phase 3D satellite in the near future. Lyle will discuss features, systems design, integration, and experiments. The goal of the presentation is to zero in on the communications capabilities of RUDAK, the performance to be expected from the 153k6 PSK system, the limitations and capacities of the DSP modems, user requirements for receiving RUDAK, requirements for transmitting to RUDAK, and how amateurs can work to make ground operations a reality once the satellite is in operation. Information on how to submit a proposal for experimental time on RUDAK will be presented. The second presentation will be by Tim Shepard, KD1KY, regarding "Packet Radio Networks with Millions or Billions of Stations." This talk will present concepts and materials that make you think about different possibilities of networking in the future. Both Lyle's and Tim's presentations focus on different aspects of future digital communications possibilities.

Third Annual ARRL and TAPR DCC Student Papers Award

The deadline for the third annual ARRL and TAPR Student papers is past, please think about having students submit next year for the travel awards. TAPR and the ARRL especially welcome papers from full-time students to compete

for these student papers award. Two $500 travel awards may be given, one in each of the following categories: a) best technical/theory-oriented paper by a student, and b) best educational or community-oriented application paper by a student. The paper should relate directly to a wireless digital communication topic (see the guidelines for more information). Papers co-authored by educators or telecommunications professionals are also eligible for this award as long as a student is the first author. The deadline for receipt of finished student paper manuscript is June 20, 1999. Please note that this deadline is different from the general conference paper submission date. For full details and paper guidelines contact TAPR or browse to http://www.tapr.org/dcc.

Call for Conference Proceeding Papers

Anyone interested in digital communications is invited to submit a paper for publication in the Conference Proceedings. Presentation at the conference is not required for publication. The primary purpose of the conference is to communicate ideas and techniques regarding digital communications. Papers written in an informal style are welcome, as well as those written to academic standards. If you know of someone who is doing great things with digital communications, be sure to tell them about this! Papers are due by August 15, 1998, and should be submitted to Maty Weinberg, ARRL, 225 Main Street, Newington, CT 06111, or via e-mail to lweinberg@arrl.org. The paper submission guidelines are available on-line (http://www.tapr.org/dcc).

Local/International Co-Host

The 1998 ARRL and TAPR Digital Communications Conference will be co-hosted by Chicago Amateur Packet Radio Association (CAPRA). CAPRA is one of the oldest packet radio groups in the US. It focuses on education about amateur packet radio, coordination of joint efforts of hams interested in packet radio, and technical and equipment support for a sound packet network in the Chicago area. They have had high-speed packet networks operational since the mid-1980s. Visit the CAPRA Web site at http://www.imaxx.net/capra for more information.

PRUG (Packet Radio User Group of Japan) will be the first International co-host of the ARRL and TAPR Digital Communications Conference. The conference is proud to welcome PRUG as part of the conference. PRUG will be hosting an informal social Friday evening after the seminar and symposium are completed. Visit http://www.prug.or.jp for more information about the organization.

What can you expect during the 1998 ARRL and TAPR Digital Communications Conference?

* A full day of papers, breakout sessions, and selected topics on Saturday for the beginner to advanced amateur digital enthusiast.

* Three seminars/symposia
Friday (1 PM)
- Second Annual APRS National Symposium,
moderated by Steve Dimse, K4HG

Friday (3 PM)
- Infrastructure Technologies in Amateur Radio
conducted by Don Lemke, WB9MJN

Sunday (8:30 AM)
- RUDAK Future Operations and Experimentations
by Lyle Johnson, WA7GXD
- Packet Radio Networks with Millions or Billions of Stations
by Tim Shepard, KD1KY

* Third Annual Student Paper Awards.

* TAPR Membership Meeting

* A banquet with special guest speaker Steve Roberts, N4RVE, of Nomadic Research Labs. Creator of the Winnebiko and Behemoth high-tech recumbent bicycles. His current project is focused on Microship technology (http://www.microship.com/).

* SIGs (Special Interest Groups) get-togethers on Saturday, following the banquet

* Informal get-togethers throughout the weekend

* A facility that is perfect for this type of conference

* Informal engineering discussions/demonstration areas

* Motorola Museum located in the area.

* An event at which the most important new developments in amateur digital communications are announced

* Digital 'movers and shakers' from all over the world in attendance

---

Conclusion

If you have attended a Digital Communications Conference in the past, remember how much fun it was discussing the latest developments into the wee hours! If you have never been to a Digital Communications Conference, then make your plans now to attend and find out how much fun they can be.

There are few activities where your participation can be so much fun and so important! You will be able to get together with colleagues from all over the world and bring each other up to date on your latest work. Experience all this and more for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to

see you at the ARRL and TAPR Digital Communications Conference, September 25-27!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road #337, Tucson, AZ 85749-9399, phone 940-383-0000, fax 940-566-2544, e-mail tapr@tapr.org, browse www.tapr.org/dcc.

Sincerely,

Steve Ford, WB8IMY, ARRL Conference Co-Chair
Greg Jones, WD5IVD, TAPR Conference Co-Chair
Steve Stroh, N8GNJ, Conference Manager
Mark J. Thompson, WB9QZB, Local Host Liaison
Carl Bergstedt, K9VXW, Local Host Liaison

Note: If you need conference handouts or flyers for ham club meetings, contact TAPR to get what you need!

Hotel Information

Conference presentations, meetings, and seminars will be held at the Holiday Inn Rolling Meadows. Special DCC rooms rates are $85 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC in order to get the discount. It is highly recommended that you book your room prior to arriving. A block of 75 rooms is reserved until August 31, 1998. After the 75 rooms are booked, rooms will only be available in nearby hotels, so be sure to book your rooms early! The hotel provides transportation to and from O'Hare Airport. Please contact the hotel to arrange specific transportation needs.

Holiday Inn Rolling Meadows (conference hotel)
3405 Algonquin Rd
Rolling Meadows, IL 60008
Phone 847-259-5000, fax 847-259-0597

I bought an MFJ-1278 at a hamfest and didn't get any software with it.
I'm not interested in packet but would like to try RTTY, AMTOR, etc.
If anyone has some software to sell or can recommend a site where I can
download something to control this critter, please drop me an e-mail.
Thanks,
Jerry
W4RF@att.net

I use SKYRIDER with my MFJ-1278. It's a very user-friendly Windows
program. Can be downloaded from (don't ask me why it is placed in this
directory, has nothing to do with bbs or tcpip...):

ftp://oak.oakland.edu/pub/hamradio/arrl/bbs/tcpip/skyv1_4b.exe

Also download the file
ftp://oak.oakland.edu/pub/hamradio/arrl/bbs/tcpip/skyv1_5up.exe
to upgrade to version 1.5.

GL OM, CU on Pactor or AMTOR !

3517. Official Press Release - Please Read

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-09 00:00:00 UTC
From: kh2d@my-dejanews.com
Message-ID: <6qm89l$1q8$4@brokaw.wa.com>
Source record: 22802

```
***
*** PRESS RELEASE
*** DATELINE - August 10, 1998 ***
*** PRIORITY - VERY IMPORTANT
***

The Bored Of Directors here at No-SSB International (tm) have
been commissioned to conduct some totally non-scientific research.
Through exhaustive efforts and at great expense we have determined
that over 500,000 licensed amateurs in the United States alone are
not affiliated with any organization. We feel this is because there are
not enough organizations available to give the average ham the
choice of joining an organization that fits his or her particular needs.

Well, we've fixed that problem ! Now there is something available
for EVERYBODY !

* No-SSB International (tm) http://www.qsl.net/kh2d/nossb.html
* No-FM International (tm) http://www.qsl.net/kh2d/nofm.html
* No-RTTY International (tm) http://www.qsl.net/kh2d/nortty.html
* No-SSTV International (tm) http://www.qsl.net/kh2d/nosstv.html
* No-QRP International (tm) http://www.qsl.net/kh2d/noqrp.html

No Dues. No Donations. No Meetings. No Commitment. Just click
EMAIL at the bottom of the page to tell us you want to sign up and
we'll rush you a membership number that you can proudly display.
Don't get left out - our computer can only handle really big numbers,
but we don't know HOW big, so send your email TODAY !!

All of these web page organizations are in place and ready to pass out
membership numbers to the amateur population of the world in
order to insure ham radio's future in the 21st century.

No restrictions apply. Make sure you include your amateur call sign
and the name of the organization YOU wish to join in your email.

OK, we know, sooner or later somebody is going to come along and
say 'I LIKE all that stuff. What is the right organization for ME ?'.
We thought of that situation too, so right now the members of our
Bored Of Directors are working on the buy-laws for an organization
for those of you who just can't find the right one where you feel that
you'll fit in. Coming Soon to a web page near you:

*** No-WhatEver International(tm)

The organization for the discerning amateur who's just not really
sure what the heck he doesn't like. Watch for our next press release.

I don't use the T7A for packet, but you can set your squelch setting to
"open" in order to get your packet signals.

***Due to confusion over a typo, am reposting a corrected version.
Sorry for the extra bandwidth.****

Two units available.

Kantronics KPC-3 Plus in mint condition, with all original packaging
and docs. These have the 8.2 firmware level and are ready to go.
Includes power cable, and shielded cable ready to wire to your radio.
I'll ship to you for $100 EACH postpaid.

Terms are postal M.O, and I'll ship priority mail to you the same day.

Thanks and 73,
Ron WA5VFA

Hi Leslie,

Neither one. You should go with software that uses the sound card
in your computer. W95 SSTV is the one I use, works great.

For someone just getting started, I recommend beginning *cheap*.

Since you mention using a "TNC", I assume you have a computer. If
you do, then you have several options, and the best depends on the
capabilities of your computer.

If it's a 486 or better, is running Windows 95, and has a sound card,
download a copy of W95SSTV and follow the instructions included in
the files.

If it's a slower or older computer, download a copy of EZSSTV and
install it as per the included instructions. You'll need to build
a simple interface based on a 741 IC to use EZSSTV. The parts should
cost you less than 10 bucks at Radio Shack.

W95SSTV and EZSSTV are shareware available at www.ultranet.com and
many other locations. They are both very good programs.

If you find that you like SSTV and want to continue, you can register
your programs (and get additional features as a result), you can try
some of the many other SSTV programs around (JVFax, JVComm, MScan,
WinSkan, etc.), or you can buy hardware like the TASCO or Pasokon
systems.

But try it out for free first. Just download.

If your Home BBS is FBB boroadcasting headers, I would suggest Winpack
for Windows or TPK for DOS.

Hello, thanks for those who replied to my pk88 cable question. It is up and running. I have an old Tapr tnc, probably the first one made in like 82 or 83. It's about 12" wide, 8" deep and 3 or 4" tall. Problem is, it won't go to Command mode (cmd:) It has a WA8DED host mode eprom in it, circa 1986. Does anyone have a regular eprom to convert it back to a normal tnc? Know where to find one? Thanks..

Jeff

3555. Help needed: PK232MBX problem.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-15 00:00:00 UTC
From: Marty <marty-k2@snet.net>
Message-ID: <35D59B4D.DC76DC9@snet.net>
Source record: 22741
Cross-posted to: rec.radio.amateur.digital,rec.radio.amateur.packet,rec.radio.amateur.digital.misc,alt.ham-radio.packet

This TNC has worked fine with two previous computers, a 386 and a P-100.
I just changed to a P-233 and can't get it to initiate. The hookup,
serial cable and all other connections, are the same.

The PK232 powers on as it should in terminal mode; that is, the 4 LED's
on the left flash on and then the baudot light comes on. But then I
can't get beyond that point.

I've tried different com ports and IRQ's, sending *** and RESTART
commands, with and without the battery jumper. There is apparently no
further communication with the PK232.

I did find when I went from the 386-40mHz to the faster Pentium 100 that
I sometimes had to reinstall the program twice in succession in order to
get the full initiation command sequence to the tnc. I'm wondering if
perhaps the P233 is too fast for the PK232(?).

Any and all comments and suggestions will be appreciated.

Yep! It sure does. I wonder if he and his club even know? My virus program
picked it up immediately and cleaned it like it should.

First - It is a Word macro virus, Not simply the normal run of the mill virus.
Once someone picks it up they need to go out and locate a file called
"scanprot.dot". If anyone needs it, mail me. I'll send it to you via E-mail.

I would think the problem is in the terminal software you are using rather than the PK232. The PK232 won't care what speed the computer is so long as the serial port is set to the correct baud rate. First make sure that nothing else (i.e. the mouse) is trying to use the same com port. Try a different terminal program (perhaps the windows terminal program from your old windows 3.x if you have it or an old DOS program).

3561. Trouble with KPC-3 and Icom 746

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-15 00:00:00 UTC
From: "Tod J. Knapp" <todjk@mhtc.net>
Message-ID: <6r4qau$7el$1@news2.alpha.net>
Source record: 22747
Cross-posted to:
alt.ham-radio.packet,rec.ham-radio.packet,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.packet

I am trying to get an IC-746 to work with a KPC-3. I'm running in to snags.

I have wired up a cable from the TNC to the radio. Continuity checks out okay. Schematics (pin-for-pin) looks okay too.

Here's the dilemma...my rig can xmit (i.e. xmit light on both radio & TNC light up). AND, my rig can receive the signal (i.e. the receive lights on both the TNC and the radio light up). BUT, the CON [connect] light does not light up AND the terminal program detects nothing.

My KPC-3 also "hears" nothing. When I type in MHEARD, nothing comes back.

==========
QUESTION #1
==========

Could this be a cable problem OR a TNC problem?

==========
QUESTION #2
==========

Anyone have any great ideas? I've been working on this for oodles of hours now, and not ONCE have I connected to a node. Incoming signals are booming, but there's no life on my end to connect.

HELP!

73 and tnx,

Tod N9ZWY

ATTENTION ALL

If anyone has downloaded the 1 kilowatt amp project from the Southside Amateur Radio Web Site please scan the linear.doc as it contained a CAP family macro virus.

I have provided a macro scanner on the web site if you do not have virus scanner capable of checking for macro viruses

The current file that is online is clean and is date stamped 8/16/98 8:43am.

Thanks to Bob Bethman N0DGN/4 for the alert

Roy,

I have been made aware of the problem and it has been rectified

There is also a macro virus scanner on the site for those that do not have one.

Roy, I don't think it is funny either.

However please in future don't bag me or the society I represent publicly if you have NO INTENTION of sending me an Email alerting me to the problem.

It was an honest mistake which I am sure you have made at least one in your life!

Thanks to Bob Bethman N0DGN/4 who DID email me and let me know

PAKET 6.1 is a shareware program and is the most current version that I know of, but I haven't been paying much attention. I have the distribution copy on a 'QRZ' CD-rom, but it could be on other ham related media too. If you still have your registration info, you can use it to reactivate the distribution copy into the fully registered version. I don't know if it's available for downloading, but it's possible you may have it on a CD-rom somewhere.

Marty
This sounds similar to the experience I had when I moved from a 486-66
to a PentiumPro200. This was with the AEA DOS based software running in
a Window under WIN95. I changed to the AEA Windows based software and
had no problem with initialization.

Ron

Sorry for getting the name wrong (oops)

I am not doing this to make enemies from anyone (besides you look like a pretty big bloke <g>)

I am glad that you had the courtesy of warning everyone, but like I said it would have been nice to be told about the problem at the same time via Email (I don't normally browse the news groups).

If I had know of the virus prior to uploading it it would not have gone on the site, but these things happen. I know, I know I should have checked it but I didn't, an oversight on my part, and now I have to wear your (and everyone else's) wraith.

You are entitled to your opinion about me, however, uploading a virus was not premeditated and I have learned to "scan everything" (no matter who the trusted source of the file might be)

The problem has been fixed. If you don't believe me DL the new copy and test it.

Like I said I don't want to make enemies, my sincerest apologies if I have offended or caused any grief to you or anyone else.

Regards
Adam

I will point out that Word macro viruses DO NOT give ANY symptoms to the person that is infected. The only possible warning is when someone with a virus detection program happens to try to work with that file. That is why the viruses are so malicious. Your view, Ron, is a misinformed one. I work at a government facility and see these things constantly come in. ONLY by a mandated and enforced policy of virus scanning software installation can they be thwarted rapidly and easily.

The only people deserving of such language are those that create these things.

> if you if you have a goddamn problem about me telling EVERYONE ahead of time
> not to download a viruses program then your probly the shithead that put it
> up !!!

Personally, I have no problem with notifying everyone. However that includes the person with the problem DIRECTLY. If not, the problem will not be stopped.

Unfortunately this is simply a sign of these high tecnological times.

Date: 1998-08-16 00:00:00 UTC
From: cwm3@psu.edu
Message-ID: <cwm3.82.000510F5@psu.edu>
Source record: 22767

Hi to all.

I recently upgraded from FBB 5.15c to DosFBB 7.00g. The system is a 386dx25 with 8Mb Ram. SWAPP.SYS does not work with v7.00. I worked perfectly with v5.15c. Does anybody know what's happening and if there's a fix?

3582. help with mfj needed

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-17 00:00:00 UTC
From: Tandy Way <tway1@tampabay.rr.com>
Message-ID: <01bdc972$bbcef840$95085c18@tandyway.tampabay.rr.com>
Source record: 22768

I really need help here. I have a mfj 1278b and must operate it in the host or kiss mode. I am a blind amateur without access to the operating manual. I am not new to the digital modes as I had a pk232 for years so I have a good idea of what is supposed to occur. What I need help with is the commands to be sent from the keyboard in order to send and receive the various modes on hf plus things like changing speed on cw. I have figured out some of the stuff for myself but a helping hand to get the rest of the functions I need operational would really be nice. I would prefer to start with email and graduate quickly to the telephone on my nickel so we can have instant feedback and communications. so if you have a 1278b and comfortable with its operation plus can tell me about the purpose for some of the jacks and plugs on the back panel please send me email so we can work out a telephone contact. I can explain better what I know and don't know when we get together.
are elmers really dead?
regards
tandy k4ysn

come on guys

Hi,
I have just upgraded the "World of Fuzzy Digital Modes" web site at:

http://members.xoom.com/ZL1BPU/Contents.html

This site is dedicated to Hellschreiber-like text modes, and is the only site dedicated to human readable modes other than CW. The site is better organised than previously, and there are now even more interesting picture samples and some sounds you might like to analyse!

If you don't know anything about Hellschreiber, or are interested in adding new digital modes to your portfolio, check out the information here. There is software available on the site for three different human readable modes.

This is a kind of tail wagging the dog question. I live in a very small
apartment, so when I get around to buying my first radio, it is going to hve
to have a "small" antenna and a power output that won't fry my brain. So,
what frequencies (tech level) should I consider?
Dennis

3588. FS: KAM Plus TNC

Newsgroup: rec.radio.amateur.digital.misc

3601. I need help with career plans (sort of off topic)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-19 00:00:00 UTC
From: qwasty@hotmail.com
Message-ID: <6rfl6nlch1@nnrp1.dejanews.com>
Source record: 22687

I need some help with my career plans. Perhaps some of you in DataLand can share some of your experiences in order to give me a better idea of what is possible in a career and a lifespan.

A little about myself: I'm 18 years old and I will be attending my first year of college at Utah State University, starting September 29. I'm pretty smart, but there are plenty of people smarter than me. My IQ was tested when I was 7 years old at 124. I have beem a HAM radio operator (KC7YCL, tech+) since July 2, 1997 and I'm really fascinated with the potential of electrical and computer engineering; there are so many different specialties within the field. I think that if I were to earn a degree in Electrical Engineering I could use that as a foundation for anything else I try to do, like a CEO of a technology company or a physicist who could build really nifty experiments. I'm captivated by astronomy, physics, chemistry, nanotech, SETI, particle physics, theoretical physics, law, politics, economics, social issues in general, travel and adventure, culture, art, and history.

I have narrowed my long-term goals to 2 possibilties: Research scientist and/or CEO. I think my chances are good for becoming a scientist and I plan on doing that no matter what happens. Perhaps I will have a flash of creativity one day, and I might come up with something I could use as the basis for a company. Frankly I think business will be easy, so I'm not terribly concerned with that. I will be happy doing either business or science for a living; they would both be fun but science is not as rewarding financially. Either way I'd like to have PhD in something technical.

I'm fascinated by our Universe and I'd love to be one of the people who tries to untangle it all. I would think that if I really wanted to figure out the Cosmos, I would earn my PhD in theoretical physics but frankly I don't think I have the intellect or stamina for crunching abstract numbers day in and day out; I'd like to do alot of experimentation, not just calculations. Maybe particle physics or nuclear physics would be for me, or maybe a more engineering oriented field - something like nanotech, radio astronomy, or materials science. Then again, maybe a field where my contributions are not based on my calculations, but on my creativity, perseverance and accidental discoveries, like in astronomy. I'm pretty sure I can handle most math I will ever encounter but then again I haven't encountered much!

Would it be possible for me to earn a Bachelor's in EE and still earn a PhD in a more "fundamental" field like physics or something? is it commonly done? A teacher told me that if I earned a bachelor's degree in EE, I could have a PhD in another 4 years in a completely different field. does it work like that? I really have no idea...Someone mentioned I could become a patent attorney with an EE degree.

One day I'd like to run a technology oriented corporation but I'm not sure what SORT of technology. Science is more interesting, but business pays better and from what I've beem told I can do business with a background in science and not only have the best of both worlds, but I will also be a better busness person because of my technical background.

I'm prepared to spend 10 years in college (+/- 2 years) to accomplish my goals. I plan on foregoing marriage until I'm 28 years old, that should give me time to focus on school; I've been told that the average American man has nowhere near that much will-power, but I'll give it my best shot :)

If you reply to this post I would appreciate it if you sent me an email too. I'm posting this to several newsgroups and the only one I read frequently is rec.radio.amateur.digital.misc I won't mind if you jsut send me email and skip the newsgroups but maybe there will be other people who will want to hear what you have to say also.

Thanks for any thoughts you might have to offer!!!

Can someone help me out here or recommend a better newsgroup. I'm great at computer networks but lost in radio. We have motorola 900mhz pagers and the signal from skytel is poor in our little valley and worse inside our data room. At a recent conference I saw what looked like repeaters in the conference center and I assumed it was for pagers, cellphone & the like. Is there a repeater we can buy that will bring the signal for these pagers indoors with better strength?

If you can cc me at gmartin@ets.org I'd appreciate it.

Thanks

You mean the the "user I/O" 24 pin connector? I was just rearranging some
books, and happen to have the Commodore 64 User's guide with the pinout
right beside me.

This is just out of the book, and I know nothing beyond it.

It shows the connector, and on top it's labelled 1 to 12 from left
to right. On the bottom, it's labelled A to N from left to right.

3615. Connecting PK-232 to computer. Bad hum noise on TX???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-21 00:00:00 UTC
From: Garrett <garrett@telisphere.com>
Message-ID: <35DD7C0C.8100361F@telisphere.com>
Source record: 22701

Hello,
I have a PK-232MBX. Every one says there is a bad hum sound on my transmit when it is connected to my radio. I believe it is a ground loop problem in the com-port cable. I do not have the manual for the PK-232 and seem to remember something about not connecting pins 7 or 8, not sure which one solved the problem. It should be in the manual. Could some one with a manual look it up and let me know.

Thanks
Garrett

I have heard there are some internet access amateur radio sites. I would like to be able to call my home from anywhere in a tenth mile radius and access the phone line. Are there any programs that use the sound card to send and receive data simultaneously over amateur frequencies? Something that could be set up with a couple of patch cables would be best. Two transmitters, two receivers. Most amatuer transmitters have more than half a mile range.

Could a sound card and a suitable cpu be used to interface to a telephone line? I have heard that some of the recent inexpensive 33.6 and 56 kpzs modems offload such work to the cpu, reducing the price of the hardware and making upgrades possible.

A telephone line has about 40db signal to noise ratio, I think. And it's limited to 300-3000 Hz band. I would think that would be easy to sample and send with a sound card.

I already have a couple of land line interfaces to the sound card. I even have some DTMF genertor software. But nothing like the dsp horsepower needed to communicate.

Yours,

DGoncz@aol.com

The usualy way I've seen of eliminating a ground loop is to first disconnect
the shield of the EIA-232 cable *at one end* only. Failing this, Pin 7 is
the Signal Ground line of the EIA-232 cable.

I don't know what the pin connections are between the PK-232 and the radio.

Timewave Technology Inc. is pleased to announce a DSP upgrade kit for the PK-232/PK-232MBX. Timewave's renowned DSP technology moves the most popular multimode data controller ever built to a new level! The PK-232/DSP digs into the noise and rejects QRM like never before! For details, check the Timewave website - http://www.timewave.com, or call Timewave at 651-452-5939.
Order now - shipments are scheduled to start Sept. 1, 1998!

Yo me he bajado de www.qrz.com un programita que se llama BTL que sirve para recibir y transmitir Baudot RTTY con la tarjeta de sonido SOUND BLASTER pero me estoy volviendo loco para hacerla funcionar.

Si conoces otro programa te agradeceria que me lo comunicases. A mi realmente mas que RTY, me gustaria leer las seï¿½ales -TOR que se utilizan en comunicaciones maritimas, aereas y otras utilitarias.

Muchas gracias

-----BEGIN PGP SIGNED MESSAGE-----

Hello!!

I am setting up a communications demonstration
for City of San Jose Office of Emergency Services

WHEN: August 29th (Saturday)
Time: 10:00 A.M. to Noon Pacific Time
FROM: Rose Garden Park in San Jose, CA

Purpose: To demonstrate G-Tor and Pactor
protocols for emergency messaging applications
through the use of high-angle skywave paths
and NVIS portable antenna systems. I am
looking for additional stations that may
be within a 250 mile radius of San Jose, CA

Frequencies: 7081 or 7079 (mark tone freq (+/-)
and/or 3623 KHz (mark tone freq (+/-)
Modes: G-tor preferred and Pactor

Officials from City of San Jose OES and
reps from /\/\otorola Communications will
be on site.

For those who are planning to be at the
Rose Garden, set-up will be from 0830 to 10:00 A.M
and if arrangements can be confirmed with the
park rangers this week, the park may be opened
earlier on August 29th specifically for getting
equipment staged.

If you are within a 250 mile radius of
San Jose california and would like to
meet up with me on the air and run some
short messages, please email me at:

<wa6ube@ix.netcom.com>

Thanx

Trish

3625. KUDOS to Small Wonder Labs and thanks to group

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-22 00:00:00 UTC
From: Rick Mintz <Rmintz@frontiernet.net>
Message-ID: <35DF3BB4.CD16F2FF@frontiernet.net>
Source record: 22711

Hello Hamsters,

Wanted to send thanks to all those that offered useful information towards my purchase of my first QRP rig. Was looking
for a 20 meter phone kit.

Decided on a 'Small Wonder Labs', White Mountain model, 20 meter SSB kit. Also have ordered an Emtech ZM-2, 80-10 tuner.

Both will be mounted in a carved wooden box with a flip up lid. Should be an interesting project. Expect that I'll try
20 meter, QRP, SSB, Worked All States first. Maybe I'll even find the last three states toward my 5 Band WAS.

Mention must be made of Small Wonder Labs. Dave, NN1G shipped my kit upon receipt of my personal check (no 7-10 day
wait). I emailed him today since I wanted to add something to the order. Told him I would send another check. He is
shipping me the extra parts on Monday, BEFORE the check even gets there!

WOW!

The radio community deserves to know about this level of trust (especially towards a new customer). I believe that we
should all be true to our word (i.e. the check is in the mail) but in today's environment, NN1G, is to be commended.
Well, done Dave. Next time I look for a project, Small Wonder is the first place I'll look.

I expect my ICOM 765 to be lonely for a while.....

73 de Rick, W1TY/(soon QRP)

If this involves an Icom IC-735 it is a known problem. I don't recall the exact fix, but I am sure a search of the MODS sites will net you the answer.

Fine Cliff, I'll see what I can do as far as extending the time
period. I know some people may want to bug out for lunch, but
I'll see what I can do.

I'll be trying out three different types of antenna systems,
two will be dipole type systems fed with an automatic tuner.
One of them will be six feet off the ground and the other
will be about three feet off the ground on traffic cones.

The third antenna will be a military, broad-band
tactical type that /\/\otorola will be bringing
for us to fool around with :-)

Glenn, if you are reading this, my MICOM-2R is finally
scheduled for delivery at our radio shop on Monday,
August 24th via Fedex. /\/\otorola had mis-shipped
the item to another /\/\otorola customer. They have
since re-shipped it last week and gave me a
Fedex tracking number. I'll call you as soon
as it arrives and see if there is still time to at
least get your MICOM-XF interfaced to your KAM unit

Trish

Hi,

I've just got the following transceivers :

. Mobicom R2000 by Barphone
. Storno 6000
. MC 80 (UHF)
. Motorola MAXAR (UHF)
. ASCOM SE940 (UHF)
. MATRA NOKIA ER 2402 (UHF)

Who could tell me if I can use them on amateur bands ? Most of them
(R2000, Storno 6000, ASCOM SE940) are synthetized : they would be
perfect for repeaters or packet-radio links.

Thanks in advance for any information,

Vy 73,

Eric BERTREM / f5pje@france-mail.com

I believe (correct me if I'm wrong) that this is a DSP filter front end for the existing analog circuitry. Not the same thing as a full DSP unit such as the SCS PTC-II.

I'm just about to try a Tigertronics BP-1 and I see that connection to the radio calls for a wire (black) to be connected to GND on the mic plug.

The description I have isn't too clear. Do they mean the mic ground or the chassis ground pin? Or doesn't it make any difference?

TIA and 73,

Marty K1FHR

3644. Node setup for PK88

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-24 00:00:00 UTC
From: fly65@my-dejanews.com
Message-ID: <6rs52s$485$1@nnrp1.dejanews.com>
Source record: 22728

Have aa AEA PK88 with June 1990 firmware. Trying to set it up as a node, but no luck. It digipeats ok through the tnc's call but won't even connect with the alias. I am used to the Kantronics where your myalias is your node. Is it possible to set this up as a dedicated Node? Like I said it will digipeat but I would rather have it as a node where users can connect to it and check the nodes heard and stations heard. The manual doesn't reflect the current version of the tnc's firmware. It does have a few commands not listed in the manual like 3RDparty, and a few others. Thanks for any help.. Also I don't see anything in the manual that refers to seting it up as a node, but thought the newer firmware may support setting the tnc up as one.

Jeff

Hi Jeff;
Unlike the current AEA TNC's, like the PK-12 and PK-96, the PK-88
only supports digipeating. The newer units support "Gateway", which is
AEA's equivalent to the KaNode that Kantronics has standard in their TNC's.
No revision of firmware supports that mode in the PK-88.
73, John, NJ0M

You sure that is the Mike jack. I have BP-2m and the
conections were (for rigs other than Kenwood and Yeaszu) only one wire
got grounded that was a wire (don't rememebr the colorss) to mike
center one to speaker center and and to the speaker grond which
conects to chassis ground

3651. => YAM at 1200 Bauds available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-25 00:00:00 UTC
From: f5pje@france-mail.spam.com
Message-ID: <35e26f9d.2438926@news.pratique.fr>
Source record: 22588

Hi,

this mail to inform you that YAM, the tiny Italian modem, is now
available at 1200 Bauds, as well as 9600 Bauds : simply change the
init. file and that's it ! Attention : the 1k2 YAM only works with
TFPCX 2.71 at this moment, time for programmers to adapt their drivers
(PC/FlexNet, linux, etc.)

In addition, YAMSER has now changed to version 1.2, solving a bug with
the txdelay setup.

You'll find all up-to-date drivers at
http://web.avo.net/infracom/updates.html, and more information about
yam at http://www.microlet.com/yam (PCBs and explanations only),
http://web.avo.net/infracom/yamg.html (kits or assembled versions,
with drivers and manual). or http://www.wimo.com for German readers.

Take a look at YAM, it's certainly the easiest way to run 1k2 and 9k6
on the same interface, with good performances.

For sale, HA-201 2M amplifier. Great for getting that HT signal out.

Output 8 watts with 1 watt in; 1.5 in, 10 out. Appearance is very good.

It has been modified by substituting a carrier operated relay(COR) for
the original diode switching TR circuit which noticeably attenuated the
received signal. Also, SO-239's have been paralleled with the original
RCA jacks for both input and output. Dimensions: 5.5"x3.5"x3.0".

With original manual. $35 plus shipping from CT.

Marty K1FHR

Gordon West Radio School Presents:

A
General 13-wpm Morse Code
And Theory Review Class

October 10th & 11th 1998 (San Diego, CA)

General 13-wpm Morse Code and Theory Review Class - 10/10/98 and 10/11/98
==========

Location: West Marine, San Diego, CA.

This class is for mariners that want to upgrade to the General Class
license, but like many people, find the 13wpm Morse Code requirement their
biggest stumbling block! Make 1998 your year to upgrade. Don't let the
Code hold you back any longer, the Worldwide HF bands are waiting for you.
In fun, stress-free way, your instructor will take you from a shaky
8-wpm all the way up to 13-wpm, or higher, in preparation for your exam
on Sunday afternoon! Techniques in passing the CW exam will be taught, and
there will be multiple demonstrations showing just how easy it is for YOU
to pass the 13-wpm, or even the 20-wpm code exam! Theory review sessions
are held throughout the two days to help make passing the written exam
even easier. Students that pre-register will receive the Gordon West
"General Class" textbook, Gordo's exclusive CW tapes, and a special
pre-study package. The class fee includes sixteen hours of tuition,
beverages and lunch on both days and a barbecue on Saturday evening.
General Class students join Gordo and his No-Code Technician class for an
operating session and workshop dedicated to installing, using and
maintaining ham radio equipment aboard yachts and powerboats.

--==--

Weekend courses include:
o Beverages, snacks and lunches
o Saturday night "Operating Session" with Gordon West
o Home study package consisting of CW tapes, book and
computer software
o Audio tapes for home study
o Sample test preparation exams, just like the real thing
o Multiple code test-passing opportunities

Only Prerequisite: All students must be able to copy code at 8-WPM prior
to coming to class.

For full details on either of the classes described above, please call
Gordon West at (714) 549-5000 between 10am and 4pm, Monday through Friday.

3661. HF-Data Demonstration - SF Bay area - August 29th - updated plan and schedule

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-28 00:00:00 UTC
From: Patricia Gibbons <wa6ube@ix.netcom.com>
Message-ID: <35E6CEA0.15E7@ix.netcom.com>
Source record: 22598
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.antenna,alt.ham-radio.hf,alt.ham-radio.amtor

Further update!

City of San Jose ARES/RACES will be setting up a demonstration
of HF radio using NVIS antennas from the San Jose municipal
rose garden.

Anyone who has HF data capability and is within a distance
of zero to 250 miles of the San Franciso Bay area is urged
to try connecting with my station: wa6ube, via pactor or gtor.

Anyone wishing to drop by in person and needs directions,
please leave a voicemail message at: (408)277-4082,
and I will give directions to the site..

DATE: Saturday, August 29th
TIME: set up from 0730-10:00 PDT
on the air from 10:00-12:00 PDT

MODES: primarily Pactor and G-Tor protocols

Purpose: will be trying out three different types of
portable NVIS HF antennas, two using the SGC, SG230 Autocoupler
and one military tactical on-ground antenna that is broad-band
and does not need an antenna coupler.

We will be in the air from 10:00-12:00 on 7081 KHz (mark tone)
on Saturday, August 29th. We may be on earlier while in the process
of setting up equipment

Clifford Buttschardt wrote:

> so that you can access it from your location? If your goal is signal
> strength measurement using different antennas, this might be all you need.
> Cliff K7RR (W6HDO)

Yes, sounds great.. see if you can place your mark tone frequency
on: 7081 KHz. I am not familiar with the PK232, but I know that with
the KAM, you can specify the mark and space freq's. It's easier for
tuning if mark tone = 1000 hz and space tone = 1170. This allows
the radio to be set for a suppressed carrier freq of 7082 and everything
falls into place. :-)

Don't forget that if you don't sell it this way, there are a number of
local hamfests coming up.

One of the Ottawa clubs is having a hamfest on Labor Day weekend, I think
on Saturday the fifth.

The West Island Amateur Radio Club is having an auction and Fleamarket
on September 19th.

The South Shore amateur radio club is hving a hamfest on October 24th.
It's the only one I've been to of the three, and it usually has great
attendance, both in terms of buyers and sellers.

I didn't bother looking up the details, but you can find them at
the Radio Amateurs of Canada site at http://www.rac.ca
or at the ARRL site at http://www.arrl.org

Both sites have a list of upcoming hamfests.

Yes, I can and will post it to all the appropriate
HF related ham radio newsgroups here.. so far, not
a lot of people have replied but looks like 4 or 5
stations so far will be looking for us on the air:

mark tone: 7081 KHz, pactor/gtor modes

set-up time: 0730-10:00
on the air between 10:00 and 12:00
Saturday, August 29th.

From: James Jefferson <jjeffers@deskmedia.com>
Message-ID: <35E6F0FF.85C@deskmedia.com>
Source record: 22601

Hello everyone - I'm having trouble connecting my MFJ 1270C and TAPR 9600 modem together. I've followed TAPR's TNC2 dirrections. It appears however that the MFJ and a real TNC2 aren't identical in their disconnect. MFJ claims their turbo led should come on when the modem is on top, and I should be able to connect out through it and at least see the PTT light flash.

Can anyone advise me to a solution for this?? If the 1270C is not compatible with the TAPR modem then please tell me a TNC that is. This is the final stage in bringing my digital repeater on the air, and of course it is the most frusturating... I can't understand the whole backwards ass MFJ TNC2 thing....

Thanks in advance,

-James Jefferson KB0THN

The 1270 and 1270B are mostly identical to the TNC2. MFJ made numerous
changes in the 1270C. Ask them what the differences are.

Build a passive repeater:
Two antennas, and some coax.
Put one antenna outside where the signal is strong, and one indoors
hanging down from the ceiling. Connect them with GOOD coax. Both antennas
should be tuned well for the desired signal. I work in a Hospital that has
passive antennas throughout the entire complex because 75% of the staff
have pagers... :)

gmartin@ets.org wrote:

3672. Kenwood TM-G707: Data connector pin-outs???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-08-30 00:00:00 UTC
From: Gertrude Forthuber <gertrud@scout.net>
Message-ID: <35E9343A.B8EB833F@scout.net>
Source record: 22609
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.digital.misc
Body handling: Binary attachment payload not displayed: vcard.vcf

I bought last Friday a new Kenwood TM-G707 and since I like to operate packet radio I would like to connect my BayCom Modem to the Data Connector.

It seems to me that the description of the pin out in the instruction manual of the Kenwood Data cable is wrong. There is no line for PTT. After trying the some possibilities I found out that pin 3 (middle/right) seems to be PTT because the baycom can key the transceiver with this line. Pin 1 seems to be the transmitting line because I can send data from BayCom to the 707 on this line.
I have only trouble to receive data. If I connect Pin 5 to the receiving line my BayCom program indicates that it receives data, but no text is displayed. So I think my pin-usage seems to be (completely) wrong.

Does anybody outhere expericence in operating the G707 with packet via data connector??
Pin numbering is taken from the instrucktion manual of the datacable:
5 6
3 4
1 2

Any hint would be very appreciated....

Thanx & 73 de Gerald, OE1GOU

FTV can be used to receive images from Weather Satellites and Terrestrial Facsimile Stations, text transmissions from radio telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW signals. It can also transmit Amateur Radio FAX and SSTV. No external hardware, other than a radio, is required, as all the necessary signal processing is implemented in software.

FTV is now in Version 1.0k

Main features

WEFAX, FAX, SSTV, colour SSTV, RTTY and CW reception.
Transmits 8 FAX (2 in colour) and 18 SSTV (10 in colour) modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Recovery from wrong mode settings is possible.
Program works in real time (about 1 second DSP' time lag)
Images may be loaded and prepared for transmission while receiving another.

Minimum system requirements

80386 CPU
Sound Blaster compatible sound card
256K of extended memory (preferably 4096k or more)
SuperVGA graphics card with VESA support (at least 640x480, 256 colours)

Check out my site on http://www.geocities.com/SiliconValley/2504 for information on FTV - Wefax,Fax,Sstv,Rtty,Cw software for the Sound Blaster.

Brian, 9H1JS.

3675. PK88 firmware?

I have the following items for sale:

Kantronics KAM Plus - this is the newer version that does NOT require the board upgrade although it does require the $49 upgrade for the latest 8.x firmware. No manual. $150 shipped.

Kantronics KPC-3 with 128K RAM. No manual. $50 shipped.

BayPac BP-2 Packet Modem. Manuals and original box. $40 shipped.

Alinco DR1200 Data Radio. This is the 1200 baud ready 2M transceiver. It is in excellent condition. 25W output. $90 shipped.

Please send email if you have any interest:

Hello all...

I purchased a KENWOOD TR-8400 (UHF) radio. When I turn the nob forward, the display unit shows number in this order, for example:

433.620, 433.645, 433.670, 433.695, 433.720, 433.745, 433.770.....as you can see, this radio is not displaing the frequencies one by one hertz...Does it work this way?

Thanks for your replies..

Reading the info at Timewave it seems very much a DSP front end with
18 different filter characteristics and *requres* the rom upgrade to
verion 7.2 as that eprom has control for the extra filter modes.

Has anyone used one of these yet? My PK-232MBX might benefit. Wish
it also had Pactor-II at the same price :-)

Don't count on this working... The path loss is so high that in many cases
it provides little if any advantage.

On our roof here I put up an 8 dB corner reflector pointing at a 800 MHz 70
W repeater about 50 yards away. I run through 200' of 7/8 LDF into a 3 dB
antenna in our well shielded interior office. We get a very slight signal
improvement. If I didn't have the spare LDF already run and the antennas
laying around, it would not have been money well spent.

Before spending any time or money on this go through the path loss
calculations and see if your proposed scheme will provide any advantage.
You may have to go with active repeaters (ASP, KAVAL, Andrew, TX-RX, etc)
or another repeater site directly connected to a Radiax type system.

From: fly65@my-dejanews.com
Message-ID: <6sfeu8qub1@nnrp1.dejanews.com>
Source record: 22619

Hello all, I'm trying to make a dedicated packet node with a PK88. The PK88 will digipeat ok with AEA's firmware, but I wanted a "node" for packet users to connect to directly. I thought The Firmware by Nord Link was the way to go. A very generous fellow burned the "The Firmware" version 2.7 onto a 27256 eeprom for me. Nothing. Docs for The Firmware say no other modifications are needed, just the eeprom. The PK88 manual says there is a mod to the PK88 needed for NET/ROM node firmware (which I can't find). and the PK88 manual describes how to do it. Any ideas?? Now to make matters worse, I put the old PK88 eeprom back in and my MULT light stays on and the screen says " Please type a star (*) for auto-baud routine. " That's as far as I get with that. The manual says to type several *'s within 1 sec intervals to get it to auto-baud. Nothing seems to work. Thanks for any help with this.

It's true that making a passive repeater work without at least one
antenna having aperture that fills a significant part of one of the
original link antennas can be pretty difficult. Basically, at least one
end of a passive repeater needs to "catch" a good chunk of the RF in
order to make things go well. But there's another way around it, which
can work a lot better: use an OCAR (on channel active repeater).

We have been doing that with great success. If you're interested see

http://www.sonic.net/~n6gn/ocar/ocar.html

There is also a Mathcad program for calculating various scenarios, including
fully passive repeaters.

: Build a passive repeater:
: Two antennas, and some coax.
: Put one antenna outside where the signal is strong, and one indoors
: hanging down from the ceiling. Connect them with GOOD coax. Both antennas
: should be tuned well for the desired signal.

The problem with the passive repeater is that in addition to the inverse square "losses" from the transmitter to the receiver antenna and coaxial losses, there are also the inverse square "losses" from the repeater retransmitter antenna to the final receiver.

The worst situation is when the repeater is midpoint between the transmitter and receiver, in which case the total path loss is proportional to the inverse fourth power of distance from the repeater to the stations.

A passive repeater can be usable, when one station is _very_ close to the repeater antenna, such as in a 2-3 m room. In this situation, you can move freely in the room and use pager or cellular phone. However, if you try to use a single retransmitter in e.g. in a large office, the inverse square path loss makes the situation unusable, although the reflections from the walls will help a little.

The UHF signal propagates surprisingly well through windows, wooden doors and other small openings and as an office usually has a lot of them, the signal propagates through all of them, creating a reasonably strong field within the building. In such a situations, the tiny amount propagating through the coaxial cable will make an improvement only very close (1-3 m) from the retransmission antenna.

However, the situation is quite different, if all windows are covered with some anti-glare coating to keep the sun heat away (and which also seems to keep the RF out) or if there are no windows at all (rooms underground) and heavy metallic doors are used, then the signal entering the coaxial cable is the only one available and improves the reception within a few meters of the retransmission antenna. But even in this situation, you might not get an improvement at 10 m from the retransmission antenna.

: I work in a Hospital that has
: passive antennas throughout the entire complex because 75% of the staff
: have pagers... :)

I guess that the signal propagating through the windows are usually strong enough, but there might be some black spots, which are removed

with the passive repeater (or is this some of leaky feeder system
illuminating long corridors).

: gmartin@ets.org wrote:

: : computer networks but lost in radio. We have motorola 900mhz pagers and the
: : signal from skytel is poor in our little valley and worse inside our data
: : room.

One possibility is that the RF noise level at 900 MHz is so high, that
the pager signal disappears in the noise. In this case adding a
passive repeater would not help much, since the signals propagating
the normal way would be nearly equally strong. In fact you would be
reradiating the noise from the data room and this would not be a good
thing if you are processing very sensitive data :-).

However, if your data room is underground with metallic doors and no
windows, the passive repeater might help, especially if the room is
small. But your problem was also that the signal was weak in the
valley, so you would have the problem of getting the signal with an
outdoor antenna in the first place. You may have to use an directional
antenna and as there seems to be no line of sight path to the
transmitter, you may have to experiment with the antenna pointing in
order to find the strongest signal.

It seems to me that it would make more sense to use an active repeater
in this case (and it would keep the locally generated noise within the
data room :-).

This situation is far different from the typical situation in which
some kind of repeater is required (usually a much larger distance to
the main transmitter). But anyway, here is some link budget
calculations.

With 63 dB free space loss, 8 dB repeater receiver antenna gain, maybe
5 dB of cable loss and 3 dB retransmission antenna gain, the path loss
to the retransmission is 57 dB, so the retransmission ERP is 35 uW or
-9.5 dBm. If the minimum required signal at the receiver is -120 dBm
(typical for a NBFM receiver), you could still afford to suffer a more
than 110 dB path loss, sufficient for a _huge_ office.

I can only find two explanations for this situation

1) Your cable loss is much more than the expected 3-5 dB, i.e. you
forgot to tap out the water from the cables laying around :-).

2) Your interior office is not well shielded. If it is supposed to be
well shielded, then I think you should improve the shielding
considerably, since the signal seems to slip through all openings.

I guess that the signal level had been adequate _on_average_ before
the passive repeater was installed, but that there were black spots
due to multipath, in which the signal is canceled and the modulation
method used, did not handle the multipath situation very well. And
this situation was then incorrectly interpreted to be a general lack
of signal.

In such a situation adding one more carefully positioned signal source
(the retransmission antenna) will improve the reception in places
suffering from severe multipath, but may introduce new multipath
problems at other places.

I can't say that I have been able to get the software running
perfectly at 1200 baud. (probably my mixer settings)
It is my understanding that 9600 baud requires a "9600 ready"
radio. Most rigs do not use a wide enough bandwidth for 9600 baud
packet... This is true with hardware TNC/modem combinations as well
as Flexnet. Check the www.qrz.com site & see if there is a mod that
will allow your radio to do 9600 baud. (If you knew this all along,
please accept my apologies)

What most people forget is that dual path loss applies to the link
budget. First from the host antenna to the passive pickup antenna,
then second, from the passive redirector to the portable antenna. Once
you figure out the total pass loss plus the gains/losses of the
passive antenna system, it becomes evident that active gain is
required.

Brian,
Timewave Technology Inc. has complete support for the PK-232, PK-88 and other
former AEA products, including repair, phone and email tech support,
accessories and upgrades. In fact, we just introduced a new DSP upgrade for
the PK-232/PK-232MBX. For further details, check our website at
http://www.timewave.com or call us at 651-222-4858. (If the new 651 area code
doesn't work from your area, please try the old 612 area code - apparently
some telephone company switching centers are not yet programmed to recognize
the new area code!)

Thank you,
Randy Gawtry, K0CBH
Timewave Technology Inc.

3694. New 9600 Baud modem

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-03 00:00:00 UTC
From: f5pje@france-mail.spam.com
Message-ID: <35ee6b11.9526077@news.pratique.fr>

Hello,

a new 9600 Baud modem has been developped by F5RCT, using a PIC
processor.

Its main features are :

. NRZ or NRZI format
. Byte Error Rate Test, to check the quality of a 9600 Baud link.
. Auto-test, to check the PIC itself
. Watchdog
. Accurate AF tuning for RX and TX
. Calibration jumper for continous TX
. Half-duplex only
. Data output on a HighSpeed norm header (2 x 10 pins)
. AF outpu on a 5-pin DIN connector
. VERY easy to build, single-sided PCB
. English or French manual

3695. New TSTHOST tool being developed.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-03 00:00:00 UTC
From: "Alberto I. Figaredo Martin" <amartin@theaccountants.co.uk>
Message-ID: <6slquv$4t4$1@heliodor.xara.net>
Source record: 22632

Hi all.

Wouldn't it be nice if you could use a improved uproto list auto-select
with TSTHOST? Don't you find irritating sometimes to go through a LOOONG
list to select only 2 or 3 messages more? Well I do. So I'm writing this
tool for TSTHOST in C++ which I called TSTULA (TST + the UL A command
[Unproto List Auto-select]).

You get home, leave TSTHOST running for say 20 minutes to get the updated
list form your BBS. Then run TSTULA and then the UL G command (Get the
messages from the BBS). Finally you can read them when you have a spare
moment.

TSTULA allows you to select
(e.g.)
Title Contains "TST" "7+" "CQ" "MIR" "ISLA" ".JPG"
From calls "GB" "EA1DZL" "EA1DO"
For calls "EB1HCK" "INTNET" "C++" "ASTUR" "ASTDXG"
and to ignore messages.
e.g.
Ignore Personal messages for third parties Y/N
Ignore FROM "EA3DOS"
Ignore TO "CQ" "SUN" "DX"
Ignore by size >10000 Bytes

You can set which of the two will have priority in case of conflict.
i.e. ignore has priority over select
(e.g.)
from EA3DOS
but title contains TST
result = IGNORE
or select has priority over ignore
(e.g.)
from EA3DOS
but title contains TST
result = SELECT

Finally you can set it to scan:

the whole list,
or
only the new messages in the list.

In order to avoid looping TSTULA obviously does not scan messages already
downloaded.

I will be testing it at my free time form Univ.. and hopefully a Beta version will be out by Christmas (ish). But in order to test it I need unproto lists to test the tool. So would you be so kind of sending yours?? Specialty if it is maximum list length for TST. Please state which kind of BBS you use (e.g. F6FBB) and feel free to add any comments.

3696. rtty tuning indicator

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-03 00:00:00 UTC
From: dl278@cleveland.Freenet.Edu
Message-ID: <6slu32$10f$1@pale-rider.INS.CWRU.Edu>
Source record: 22633

I'm looking for some kind of tuning indicatormthat I can
adapot to
adapt to use with hf packet with the tigertronics
BP-2M, since it uses 1070/1270 bell 103 low tones
so my scope and scope adapter for 2125/2295
won't work (and it would be much to much trouble to
adapt it since I still need it for rtty and amtor)

I seem to remember an article in (I think) 73 way back when
which had a tuning indicator using led bar readouts
and (again I think) plls to detect the tones.

Unfortunately, I probably have that magaizine but it
is in storage with a lot of other stuff back in the
US, while I'm here in Germany. This article was probably
some time in the 80's.

anyone have any ideas? have the article?, know where there
is an index of 73 articles on the web or???

tnks es 73

Bill
N5LMX/DA1WG

ps.. yes, you CAN use the BP-2M in mode 3 with HAMCOMM in
spectrum mode and tune that way, that is how I do it now, but it is a pain
in the wazzle to switch back and forth ...

Looks mysterious... The step is 25kc like in the european version, but
its shifted down 5kc... At least I can tell you that its not usual
behavior...;-)
You can change the stepping with a diode (did this long ago to change
my 8400 from asian to european version and back...), but don't ask me
which one...
By the way: Did you check whether the displayed frequency is also the
used frequency?

Do a search for FTV.
It is a good image program for pcs (in the DOS mode) if your sound
card can "mimick" a soundblaster.
Good luck

"The FirmWare" is not a node software, but a simple TNC-firmware (note
that T in TNC comes from "Terminal" :-)) containing a WA8DED like
Hostmode.

You may want to use "The Net", the NET/ROM - ... lets say "Clone".
Maybe http://www.nordlink.org will help u.

TheNet will not work with a PK88, so the manual says. As far as NET/ROM, I can't find it anywhere, must be commercial.(?) I thought "The Firmware" had a built-in node, not necessarily node software but I think you could connect to it and use it as a node, maybe not. Like the KPC-3 and probably earlier kpc's have a built-in node. AEA's PK88 firmware doesn't have a built-in node.

Thanks..

Jeff

Go to www.ultranet.com/~sstv

You'll find many choices there.

If you have Windows 95, I recommend W95SSTV.

If you want a DOS program, I recommend EZSSTV.

I hope we'll be hearing and seeing YV4FNC on 14.230 in the future.

> Thanks in advance
> 73 de Max

Well not sure about the situation where you are located..

BUT ...

Here in Australia, 9600 packet does NOT use AUDIO TONES !
Sure you can generate 9600 audio out, and TX it, but have a look
at the bandwidth !, most normal 9600 experiments use FSK
and NOT AFSK, you are detecting a phase shift, and not a pair
of frequency shifted tones.

Can I suggest having a look at the concepts behind the "G3RUH"
and "YAM" modem principles.

Hope this helps you to understand just WHERE the problem is.

All the best from South Australia

Glenville.

Unless things have changed recently, I know it's not 9600 baud capable out
of the box. (usually 9600 baud capable radios will have a sperate port for
the TNC). You might be able to modify it, but I don't recall ever seeing
any files describing the process.

3713. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-04 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6snt42$3ke@news.Hawaii.Edu>
Source record: 22650
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

Jeffrey Herman (KH2PZ / KH6)
(rec.radio.amateur working-group)

3715. The history of BBS mail compression?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-04 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <ZznFiBAgk+71EwVd@peaksys.demon.co.uk>
Source record: 22652

Does any know where I can find any info on the use of mail compression by packet BBSs? I'm particularly interested in when it was first used and which BBS system was the first to use it.

Also what compression techniques were used. I know that LZH is now used by FBB, but the code for that was only put into the public domain around 1988, so any systems that used compression before then must have used a different technique.

(My interest in this is as a result of a "claim to fame" I recently saw on the UK packet network.)

3717. Re: PK88 and Nord><Link "The Firmware 2.7"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-04 00:00:00 UTC
From: Doug Younker <dougy@ruraltel.net>
Message-ID: <35F038D8.76D3@ruraltel.net>
Source record: 22654

Hello,

I was under the assumption the PK88 was a TAPR TNC2 clone and and as such would be able to make use of networking firmware. I'm unfamiliar with the AEA products and can't say for sure. I assume those of you are using the the firmware you're speacking of the program burned into the EPROM,the spelling FirmWare with caps is what's confusing me.

Kantronic units have had their own networking system, KAnode as a standard feature for quite some time. While kanode perorm node to node error corection it wasn't compatable with any of the other networking software. Now Kantronics offers a replacement eprom that includes Knet wich will fit unto and work with a network using the X1J. The verion of Knet I have doesn't support all the features of X1J, stuff like the IP router,devmeter and, chat mode...

Greetings

Having read the following:

An Inexpensive PC-Modem for 76.8kBit/s User Access
Thomas Sailer, HB9JNX/AE4WA,
and
Johannes Kneip, DG3RBU
August 14, 1998

I find that the transmit FIR block diagram doesn't make a lot of sense.

Could someone assist my understanding and explain how a
"four fold oversampling FIR filter of length 32" works with some examples
of the actual lookup table contents and how the values are derived, how those
values are then used to contruct the input to the D-A converter that then
creates the analogue output.

Cheers all

3728. RFC: Remote Microsatellite Groundstation-Internet Gateway Opportunity

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-07 00:00:00 UTC
From: Joe Sleator <sleat@zip.com.au>
Message-ID: <35F3181E.2526@zip.com.au>
Source record: 22665

Hello,

I am Systems Manager for a microsatellite project at The University of New South Wales, Australia. We plan to launch Australia's second ever amateur microsat from Woomera late next year.

We are researching ideas for experiments to fly on the satellite. I am looking for feedback on the feasibility of creating a ground network of packet radio stations which will communicate with our Low-Earth-Orbit microsatellite and relay communications to the internet via active gateway software which we would write. The goal is to create a truly amateur and grass-roots satellite resource that is permanantly online and accessible via the net.

We envisage prospective members of the remote ground network having access to a permanent internet link, or at least a reliable, speedy connection when the satellite is overhead, and to at least a 9600 BPS TNC, and groundstation equipment. Interested people would be required from all parts of the globe, so that we may provide constant contact with the sat to the internet, via the volunteers.

I invite comments and questions on this proposal.

Regards,

Joe Sleator
Satellite Systems Manager,
BLUE-SAT Project

For the KAM and the PK232, the leader seems to be the
KaGold and PKGold from interflex systems. The work
hand in hand in the development process with the
designers at Kantronics and seem to do a really good
job.

I juse the KAM Enhanced unit with KaGold and the
"robot cq" and automatic recognition of graphics
files being received are two of the interesting
items with KaGold.

It comes with really good documentation in terms of
a heavy-duty softcover user's manual and a pull-out
"cheat-sheet" of all the more commonly used commands.

From: Patricia Gibbons <wa6ube@ix.netcom.com>
Message-ID: <35F45427.570B@ix.netcom.com>
Source record: 22669

Is there anyone out there that would like to experiment with
ALE on the ham bands ?? I've noticed that my new rig, which
has Automatic Link Establishment, has an option in the programming
to not sound on an occupied channel. This seems like it may work
in the ham bands if the later versions of ALE are polite in the
respect of not sending out ALE broadcasts on a channel that is
busy.

I would like to hear from other hams that may have equipment,
surplus or otherwise, that has ALE implemented in it's design,
especially if you are located on the West Coast of the US.

The latest version of MultiMode, Version 1.0.0, is now available for MacOS computer systems.

The URL is http://www.access.digex.net/~cps/sss14.html

MultiMode is an application which allows your Macintosh to decode several different modes of non-voice communication often heard on shortwave radio.

MultiMode allows you to decode and display morse code, RTTY, fax, and many other modes on your Mac, without any extra hardware!

In the past, dedicated hardware, often costing hundreds or thousands of dollars, was necessary to demodulate and decode this transmissions. Today, you can use the
processing power of your Macintosh to decode and display these modes, without any hardware.

MultiMode decodes the following signals:

Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
SITOR-B / FEC / NAVTEX
FAX
ACARS
WWVB Time Decode
DTMF
Audio Spectrum Display to aid in properly tuning in stations

Message-ID: <ulKqapu29GA.294@upnetnews03>
Source record: 22673

If you're looking for a 32 bit Windows program, PacTerm '98 is the only one available at this time. Check out http://www.cssincorp.com/pacterm for version 1.1C.

In demo mode, you'll be able to run VHF packet with each session in a separate Window. Purchase of the full version adds the advanced features and all the HF modes.

Full documentation is available for download at no additional charge. It has been updated for the 1.1C release and it is the ONLY program at this time that supports the KAM '98 and the 3 radio port version of the 9612P.

I've said before, for DOS based programs KA-Gold is the way to go and you also have HostMaster for Dos, which is the other Kantronics OEM software, and for 16 bit programs, you have KA-Win and XP-Win. All of these programs are fine programs for the platforms they support (DOS and Windows 3.1). While they all will run under Windows 95, Windows 98 and Windows NT, they don't take advantage of the 32 bit architecture that the Windows 32 bit platform supports.

Once you purchase PacTerm '98, there is no charge for upgrades until it reaches version 2.0. All of the 1.x releases are free upgrades for any and all Pacterm '98 users.

You can purchase PacTerm '98 from Kantronics or your favorite ham radio dealer for $69.95.

Tom Sailer's soundmodem driver for Linux does do 9600 FSK on the sound
card, as well as 1200 AFSK and some 2400 and 4800 variants.

I'm yet to get it receiving reliably though, audio level problems here.

> Can I suggest having a look at the concepts behind the "G3RUH"
> and "YAM" modem principles.

Built a YAM yesterday too, now to debug it and get it running. Tom says
it doesn't do a very good 1200 though due to its A/D process.

Hello to the Group from GM0GAT, Tony in Aberdeen, Scotland, UK
Anyone out there experience and/or knowledge of using a VHF/UHF mobile rig in a car stuffed with electronic systems (eg engine management, ABS, airbags, etc).

I am wanting to put a Yeasu FT-5100 in a 4-year-ols Honda Accord 2.0i (a UK vehicle). Can I run the full 50W on 2m and the full 35W on 70cm without jamming my brakes on, deploying the airbags and revving the engine to >7000rpm.....!!

Any useful comments please to:
tony@rgu.u-net.com

Honda in the UK were particularly unhelpful - in fact they were quite obsstuctive.

Regards to all from a newbie to the group

3740. Amateur paging with KPC-9612 Plus.

I would like to hear about people's experiences, success or failures in trying to create an amateur paging system with the Kantronics KPC-9612 Plus. This TNC supports 512, 1200, and 2400 bps POCSAG paging. At this point I've had limited success.

Also, I would be interested to hear about details regarding re-crystallizing pagers, apparently Kantronics has just pulled out of this operation altogether.

Please respond via email, thanks in advance.

xpware for windows. does all the modes including clover and
pactor-II. also talks to several tnc's at the same time. also does
rig-control. try that with kagold, or pkgold. i asked interflex when
they were gonna get on the win-95 bandwagon and they showed no
interest in doing so.... so i asked, well how about rig-control??
they said that aint a gonna happen either.
oh by the way.... xpware does HF file transfer.... try that with
kagold.... it wont happen.......

im curious, if interflex works so closely with the designers at
kantronics.... how come kantronics had to get a third party software
writer to write pacterm-98??? i asked this questions to phil
anderson personally at las vegas last year and he said "interflex is
locked into the dos world aren't they??"

Four fold oversampling here means that there are four samples per symbol
resulting
in the oversampling over the symbol clock. 32 is the length of the FIR
filter -
8 symbols long , 4*8=32...

The idea behind this way to design the FIR filter is that the input to
the filter
are the symbols to transmit : -1 or 1. Given an 8 symbols long FIR
filter there
are only 256 different inputs possible for the filter. Thua for any of
these
possible input signals the resulting output of the FIR filter is stored
in a
table - here an EPROM. Now you do this for the four possible phases of
the oversampling and
increase the table size by four. I think now the operation of the filter
should be
clear: there is actually no filter, but as there are only a limited
number of possible
input signals there can only be the same number of waveforms at the
output.

Hi,

I am new to packet and am trying to keep things cheap. I have a basic laptop to use that is a 286, and I am running DOS. I would like a terminal program that I can use in DOS, nothing that special is needed, and that will interface and control my MFJ 1270B and 1274. I have been told that ProComm was very popular a while ago, is it still available and is it DOS based. Are there any other programs. What about Interflex and the Gold Series, will they do what I need. Also, if it is shareware or freeware, that would be great as it would reallt keep the costs down. I can always upgrade when I realize what I am missing in the future. Please E-Mail all responses.

Thanx for the help and info
Mike

Hallo Brian,

The 232 is ok, but the PK88 modem is verry sensitive fore HF exited by your
TRX,.
I experiencted with my HAM CB tranciever that when power was up to 4 Watts
the audio signal caused by HF made the modem not to function as it should.
Other colleges had the same problem.
I even tried to place some ceramic condesators to shortcut the HF, this
dind't work as well.
So take the 232, but make shure there is a DCD in it, it will make work
things better, than working with a soft DCD as provided in the TFPCX driver.
Excuse my bad English.

You can get a list of the commands from the 1278 itself by using
the command DISPLAY at the cmd: prompt...It's quite a long list
and no definitions or entry variables are provided...Your best
option would be to find or buy a printed manual...Maybe someone
has one available that will read this...I don't know what the
latest software release is, but I have one with version 3.4 in it.
Take a look at MFJ's site and maybe you can find it there...73

The Gold programs from Interflex only work with a TNC having host mode.
Although the later TAPR, MFJ and PacComm firmware has a host mode, nobody
has written any software to use it effectively, to my knowledge.

I would recommend you take a look at paKet 6.1, which offers some of the
same features (multiple screens for different contacts, etc.) but will
work with the normal TNC command set. You can download it from
ftp.tapr.org in /tapr/software_lib/terminal/paket61.zip. It is shareware,
but fully functional, however if you register (which you can do through
TAPR), it will be a bit friendlier. Yapp (at the same site) is another
popular shareware program (with fewer features) for DOS use.

From: aef8w@aztec.asu.edu
Message-ID: <6t99gd$895$1@news.asu.edu>
Source record: 22497

DRSI repair rates - April, 1998

Ran into a snag on the VN10LM devices. They are obsolete (or so my supplier tells me) and the SK9155 is the only substitute I can find. So - the rates for future DRSI board repairs will be:

Type 1, 2 or 3 DRSI boards - flat rate including small parts $50.00

If the board requires a VN10LM (will be replaced with an SK9155), Z8530, Z8536 or a TCM3105 add $10 (to the $50) for each device required. These ain't cheap.

Still have no information on IC1 (PAL20L8) so will cross that bridge when we come to it.

I will guarantee the repairs (parts & labor) for 60 days from the day I send the board(s) to you. If I cannot repair the board it will be returned to you at no charge.

Further, you may elect to send the boards to me other that USPS if the package will not fit in a standard rural mailbox as my carrier just told me they are not supposed to bring packages to the door if the house is more than 100 feet from the box, and I am.

Wonderful, just the sort of thing I needed to get me going, I won't be
putting the thing up on packet till I have a look at a manual but
that's plenty to get me going decoding stuff. By the way do you find
it very noisy RF wise?
Even with a long wire fed via a MLB and a properly grounded run of
coax it still makes a racket on HF

Source record: 22500

Greetings all

I recently acquired an MFJ1278B but no manual. I've downloaded hookup information and some shareware PC software. MFJ wants $22 for the manual to my door.

I'm confused about whether my PC can communicate to the 1278 by simply connecting the RS232 port and typing DISPLAY or do I have to have driver software installed or maybe a terminal emulator program for the basics.

Anyway... I'd really like to be able to check it out while I'm trying to find a manual. Im pretty confident abt all the electrical connections. I will be using a Kenwood TS140, the MFJ1278B and an AT11 ant tuner.

Can anyone help me get started ?

Thanks in advance

I have looked at several sites that have software for RX/TX 1200 and 9600 baud VHF Packet radio but don't seem to find good information as to how one might wire things up.

http://www.muenster.de/~welp/sb.htm
http://www.forthnet.gr/sv2agw/start.htm
http://dl0td.afthd.th-darmstadt.de/~flexnet/

I have a Soundblaster 32 (non-AWE) with an extra 2 megs onboard memory (they accept standard 30 pin simms).

I have a HTX-202, an amp, and the information necessary to tap the HTX-202 for 9600 baud.

Specific Questions:

1. What software programs are folks using successfully for 1200 and 9600 baud packet
with a Soundblaster board?
2. Is some sort of interface device required between the rig and the SB board?
3. What hardware wiring system are folks using?
(Anyone have the precise details for a HTX-202?
4. Anyone seen something for Clover?
(I've seen the listings of RiTTY and PSATOR for Pactor, RTTY and Amtor)

--
Thank You! & 73, DavidC AA1FA

3764. P.C Monitor R.F Hash !! - HELP !!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-11 00:00:00 UTC
From: "Glenville." <gsawyer@dove.net.au>
Message-ID: <35f8fbfe.0@news.mtx.net.au>
Source record: 22503

Boy do I need some ideas !

Out there how many others suffer from bad R.F / Broad-band radiation from
their P.C Monitor ???

My P.C is clean and reasonably quiet across the High Frequency R.F Bands,
but while ever the monitor is running (hard to use the P.C without it
really), then the
"HASH" level around here increases DRAMATICALLY, yes it has the customary
FCC radiation sticker etc etc, but that seems to mean Diddly in actual
terms.

I have tried a "Ferrite Clamp" on the power lead, tried running from a
different
power outlet to the receiver and P.C, and have tried a "Ferrite Clamp" also
on the
VGA cable to the monitor, can anyone throw some more (hopefully Easy) to
implement
ideas my way ?

Thanks - trust me I need all the help I can
get.

The place is a sellers paradise. Not uncommon for units to go for 2, even
3 times their actual worth. The buyer is happy, the seller is extremely
happy. What more could you want?

The linux soundmodem driver should work nicely, although I'm having
audio level problems getting it to receive correctly here.

> 2. Is some sort of interface device required between the rig and the SB
> board?

From what I read on the linux-hams mailing list, it should be okay to connect
the speaker out direct to your line in, or maybe use an audio transformer
(8 ohms to 1k ohms or so). The other direction is probably okay too, although
in my case some circuitry is required to combine the PTT and audio signals
(it's a Yaesu FT-411 handheld).

Those auctions are real scams. I just looked at the one ZDnet is
promoting, apparently run by Egghead. They show required minimum bids
for some items equal to everyday retail prices I've seen. And then you
add an inflated shipping cost.

Caveat Emptor!

I think most people don't realize that many of the outrageous prices on Ebay are NOT real !!

So far eBay has made two changes: Several weeks ago which added a key to each bid form. With a little work, programmers were able to get around this. Now eBay is about to make a new change, which will randomly change security methods, making it almost impossible to write a snipe program. Now eBay says sniping is still allowed, but automated programs won't work anymore. Why disable automated programs? Because it allows "bid robots" to roam freely on eBay. What do they do? They bid insane amounts on thousands of items and hours... with no intention of paying, bumping out people who would. Sniping is the practice of waiting to submit your bid seconds before the auction closes making it impossible for anyone to place a bid after you.
As you can see, thousands of bids per hour are being made that are completely bogus!
If a bid is so outrageous that it doesn't seem real, it probably isn't!

>their P.C Monitor ???

This is usually the primary source of RFI. The magnitude of the problem
varies from bad to horrible with consumer grade monitors. A very few of
the high end monitors have the proper shielding to prevent this noise, but
the monitors most of us can afford don't.

> I have tried a "Ferrite Clamp" on the power lead, tried running from a
>different
>power outlet to the receiver and P.C, and have tried a "Ferrite Clamp" also
>on the
>VGA cable to the monitor, can anyone throw some more (hopefully Easy) to
>implement
>ideas my way ?

Ok, there are two sources of RFI associated with a monitor. The strongest
source is generally the harmonics of the vertical and horizontal sweep signals.
These are high current sawtooth waveforms applied to the yoke of the monitor
to deflect the electron beam. The RFI will appear as harmonics of these sweep
signals. You can't suppress these signals at the source since they are essential
to the functioning of the monitor. At least the lower order harmonics are essential
also to provide the sawtooth shape of the waveform. Typically, this sort of noise
will show peaks at multiples of the sweep frequency. For a 640x480 display, that
will be at roughly 15 kHz intervals across the band for the horizontal sweep,
and at 60 Hz intervals for the vertical sweep. Higher resolution monitor settings
will have larger separations of the noise peaks due to the higher sweep frequencies
used.

The second source of RFI is the video drive to the Z-axis of the CRT. For a
color CRT, there are three drive signals, one each for red, green, and blue.
These too are essential to the functioning of the monitor. Because a computer
monitor displays its video as discrete pixels, the R, G, and B waveforms are
stepped rather than smoothly varying. These steps contain harmonics, as
does any squarewave, and those harmonics can appear across HF. Since
the state of any given pixel varies with the content of the video being displayed,
the noise from the video drive will change its distribution across a HF band
with changing picture content.

Okay, with those basics out of the way, you should be able to tell whether
the interference you are experiencing is primarily sweep related or video
drive related. Change sweep rates (by changing screen resolution) and
change video content (by displaying different content) while tuning across

a HF band. The characteristic changes in noise with frequency of the two sources of interference should allow you to judge which is predominant.

Now if the interference is primarily video drive related, there are some suppression steps you can take. First, make sure the video cable to the computer is shielded, and that it uses metal hoods which are properly screwed down at the connectors. Several ferrite beads on the cable can then help to suppress the noise. You can go a step further. Inside the monitor are video amplifiers which drive the CRT RGB guns. Place a small ferrite bead over the leads of each of these amplifiers where they attach to the small circuit board at the CRT neck. Don't use too much ferrite loading here or the picture will become smeared.

If the interference is mainly sweep harmonics, then you can add ferrite beads to the sweep leads of the yoke. Again, don't use too much or the sweep geometry will be disturbed. Warning, this is an electrical shock hazard area, know what you're doing and work safely.

Now both of these treatments will help, but they are unlikely to cure the problem. The only real cure for the problem is to fully shield the monitor. Unfortunately, most computer monitors are in unshielded plastic cases. That's why they are so noisy. The fix is to properly shield them. You can build a complete metal shield enclosure for the monitor, or you can attempt to improve the shielding properties of the plastic case with conductive sprays and copper foil tapes. GC makes a conductive spray and 3M makes adhesive copper foil tape. (You can also use copper window screen wire mesh for areas which require ventilation.)

You can apply these treatments to the outside of the case, ugly but effective, or you can attempt to apply these treatments to the inside of the case. If you attempt the latter, take precautions to prevent high voltage arcing from the TV components to the now conductive case. Fish paper can be glued in place around the HV circuitry to prevent arcing.

Whichever method you choose, the shielding must be complete, and completely bonded, using good VHF shielding practices. No seam should extend more than 5 cm without a screw, paint must be removed from joining surfaces, mesh has to have small enough aperture to prevent RF leakage, etc. A color CRT is inherently self-shielded on its face by the shadow mask. This must be bonded to the rest of the shielded cabinet. Spring contacts at the DAG coating will suffice. For monochrome CRTs, you must supply external shielding, fine black wire mesh will suffice for this, and also double as a glare shield for the display (this will work for a color CRT too if you aren't sure you can get a good bond with the shadow mask).

With the external cables shielded and ferrite loaded, and the *power cord* adequately filtered, you should now have a Tempest grade monitor which will emit practically no detectable noise. Then you can go back and improve the shielding of the computer, keyboard, and mouse, which will now be audible since you've quieted the

monitor. The same sorts of techniques work for them too.

You can have a dead quiet Tempest grade computer system if
you're willing to work at the problem. It isn't easy. It takes a lot of
labor to do it right, and a bit of knowledge about good shielding
and suppression practices. This all takes time, and time is money,
which is why the manufacturers don't do it. But you have the time
as a hobbyist, and the materials needed are reasonably cheap.

And while we're on the subject of shielding, your radio could probably
stand some improvements in its shielding too. If you are using an
external antenna fed with good coax using a choke balun, then the
only way noise should be able to enter your radio is via the antenna.
And since that's far from the computer, the noise should be minimal.
But I bet it isn't, and that's because the noise is getting directly into
the radio due to its poor shielding, or getting through the poorly shielded
coax, or traveling up the coax to the antenna.

Ok, first test. Disconnect the antenna coax from the radio and terminate
the antenna socket with a 50 ohm termination (just a 50 ohm resistor
soldered in a coax connector). You should now hear absolutely *no*
computer noise. If you still hear noise, you need to work on the shielding
of the radio (and probably the suppression of its power leads too). The
same sorts of practices applied to the monitor also work for the radio.
Make sure that the paint is removed from all joining surfaces, use a
screw at least every 5 cm along every seam, add wire mesh over
(or behind) the display and meters, etc. The goal is to make sure that
the radio will only respond to signals coming in its antenna connector.

If the radio is quiet with its input terminated, then take a look at your
coax. Is it good grade and not Radio Shack crap? Is there a choke
balun to prevent common mode currents from sneaking up to the
antenna? Etc. And take a look at your ground system. Grounding a
radio or computer generally won't improve the RFI problem, but it
can often make it worse by providing ground loops. Make sure you
are using only single point grounding technique, IE all system grounds
only join at *one* common point, and that point is then directly connected
to Earth. This will short out any ground loops, and the noise coupling
they can provide. Also watch cable dress. Don't use neat cable bundles.
This allows cross coupling. Keep cables well separated, and run cables
most likely to cross couple at right angles to each other.

Often, just improving station layout, grounding practices, and paying
a bit of attention to using good shielded and suppressed cables will
give you a quiet enough system without having to resort to the Tempest
grade shielding approaches. But that latter approach *will* work for
any computer and radio. They *can* be made to be non-interfering.
It can be a time consuming job, though.

Yes, you need a terminal emulator of some kind. You can use Terminal.exe if you have Windows 3.1, or Hyperterminal if you have Windows95 for "testing" purposes. After that, you may wish to get a terminal program that is designed to support a packet controller. There are many available. You can download my packet terminal (shareware) from the WEB site below. If you need a DOS program there are many available for download such as LanLink, etc. You can find them at the ftp site www.qrz.com.

I haven't had this happen to me (yet), but I know I've seen many items re-listed a few days after the auction closed, with a note indicating that the seller had been "stiffed", or the buyer never responded to the seller's emails. Sounds like auto-sniping to me.

Actually, I've sold things on eBay for prices that astonished me, and I have yet to be stiffed by a buyer (at least on a high-$$$ item; I have been stiffed on a couple of nickle-n-dime items). However, you're right; there are plenty of items that close at totally unrealistic prices, and I'm certain that no one, even a rich dude with lots of money, would bid that high.

to which steve s. commented and asked?

>
> Interesting I was not aware this was hapening. Has anyone here sold
> an item on ebay where the successful bidder could not be identified?

Nope. I've got several items on ebay right now that seem pretty normal prices. The Heath amp is a little low and Philmore chrome mono tube preamp seems a little high... But it is NOS unused in it's original box w/ paper work and parts bag.... - the S&G safe lock seems a bit light - but I figure there's just not that much demand for that kind of high secruity lock... The plasitic model submarine kit at $52.00 is just about right - I paid $40 ea. from a dealer for two of them about a year ago - so like I said - that seems about right... The Mini Pops rhythm unit who knows??? I'll be happy where ever that ends up (came on the Hammond A100 I bought a few months back - on ebay - which was super low!!! (you can't hardly touch a Hammond B3/C3/A100 class organ around here for under $3500 - and nice ones reach $6000 -- I bought a _really_ sweet A100 in great shape for $1500 - on ebay... The bid robots must have been asleep! (as were about a zillion others looking for a good deal on tonewheels!). Old multimeter at $1 is maybe a tad low - I've sold some pretty pricey stuff on ebay - never had a problem with the high bidder...

best regards...

3777. Feasibility of Internet Amateur Radio Servers - A Discussion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-11 00:00:00 UTC
From: k7on@qsl.net
Message-ID: <76B89C01F18AB705.620AE665EF35031F.F324597F1105A974@library-proxy.airnews.net>
Source record: 22516

Feasibility of Internet Amateur Radio Servers - A Discussion

The popularity of the internet has increased drastically in
recent years and this growth will likely continue for the
forseeable future.

Among those caught up in the craze are ham radio operators
who have created personal web sites for their stations and
activities. Some have even implemented interesting connections
between the internet and the radio waves. This latter development
is the primary focus of this discussion.

Below is a list of some current amateur radio applications
of the internet:

1. Personal Web Pages
2. Club Web Pages
3. Informational Web Publishing
4. Usenet Newsgroups
5. E-Mail
6. Online Keyboard Chat
7. Mailing List Reflectors
8. Discussion Boards
9. Web Cams
10. Dx Telnet Clusters
11. DxPedition Log Book Query
12. Remote Radio Control

Obviously, the possibilities for live audio and video are limitless
and even the possibility of watching live ATV from another country
or a balloon launch are very exciting!

Presently, most of us purchase or acquire internet access and
services from an ISP (Internet Services Provider). We users run
"client" programs on our computers and the ISP acts as the "server."
As a result, what we are capable of accomplishing is limited by the
capabilities and policies of the ISP.

It is, however, now very practical to assemble a "server" of significant
capability for even the amateur budget. There are really three areas
of investment in such an undertaking - hardware, software, and
connectivity.

As an example, I recently assembled a server from available components
purchased new (but carefully):

$110 Dual Processor Motherboard with UltraWide SCSI
$500 2 Intel P-II 300MHz processors with fans
$200 128Mb RAM
$375 9Gb UW SCSI Hard Drive
$ 65 ATX case/power supply/extra fan
$ 80 32x SCSI CDROM
$ 15 3.5" floppy drive
$ 80 2 10/100bT PCI ethernet NICs
$ 65 AGP video adapter

Total = $1490

Obviously, this represents a significant investment, but
this is a real "server" and the price is comparable with
personal desktop "client" computers (though not those
in the new <$500 class emerging).

The choices for software presently seem to be dominated
by Windows NT Server or Linux. I had an unused NT Server
license, so I'm using that for now, though nothing is cast in
stone at this point. The nice part of this is that I can use my
Win95/98 applications on the server for other applications.
In either case, software costs are not prohibitive.

Either NT or Linux easily provide the ability to serve web pages
and many other services. Obviously, with a personal internet
amateur radio server comes total control of the system and
interfaces.

That last item, connectivity, is more of an issue (economically
speaking). The present approach for low cost server connection
seems to be "co-location" where the server is located physically
at the site of an ISP. This works well for many applications, but
less so for Internet Amateur Radio as access is limited and radio
gear interfaces are a problem.

Other choices available to the amateur, of course, are 28k8 to 56k
POTS, cable modems, ADSL, satellite, and RF services. Each
has advantages and disadvantages in terms of cost and bandwidth,
especially UPSTREAM bandwidth.

Presently, I have a microwave RF service giving me a 10Mb/s downstream
connection paired with a 33k6 POTS modem upstream. In some cases, the
downstream speed even is limited by the backstream (upstream) latency.

A cable modem connection may provide a better upstream, if available
and if the cable company allows personal servers. ADSL can provide
good downstream and upstream service if available and affordable.

Cable companies, telephone companies, and others are all working to
provide affordable, practical connectivity of greater bandwidth than
POTS. When available, the roles of "provider" and "consumer" may
change drastically. The possibilities are quite intriguing, anyway!

73, Brian

OBTW, this is just a quick email note, but I am interested in possibly "publishing" a more complete and researched discussion of the above issues. If you are aware of references, I'm interested! Or, if you have any comments, I'm very interested!

Unlike other auctions E-Bay only offers items for sale by
individuals and then they get a percentage of the selling price.
E-Bay sells nothing itself. Those high prices on E-Bay are the result
of _Human Nature_, people let their ego's get out of hand and then pay
ridiculous prices just to win the bid. I always buy items via
pricewatch www.pricewatch.com or off the misc.forsale newsgroups and
then sell via E-Bay.

Hi John OM,
You have to remember, ebay is not in the 'real' world, it is just the
SF Bay Area, HI! Too bad there is not an 'ebay' in some other part of
the country where prices paid for things are much lower.

I must say, after the flame wars on this topic in the past, you are truly a brave soul. But overall an excellent review. Here's a few more comments you might want to consider.

In article <F324597F1105A974@library-proxy.airnews.net>, Brian Short wrote:

>It is, however, now very practical to assemble a "server" of significant

>purchased new (but carefully):
>-------
>Total = $1490

Actually, it is quite possible to assemble a server for far less money than that, especially if you're mainly interested in serving >=9600 baud radio links or light to moderate internet traffic. Linux and numerous versions of BSD provide some of the best software which has relatively low hardware demands. 486s and even 386s with a fair amount of RAM and a reasonable hard disk are fine for all but video and audio streaming applications. One of the compaines I worked for in the past just gave away several computers that would have made great servers. With a little leg work this cost could actually be brought down to zero. With recent work in Beowulf class computers and remote forking software, you could easily assemble a server capable of some pretty high loads for free. (Look up the Stone Souper Computer for more details).

>That last item, connectivity, is more of an issue (economically
>speaking). The present approach for low cost server connection
>seems to be "co-location" where the server is located physically

>less so for Internet Amateur Radio as access is limited and radio
>gear interfaces are a problem.

Once again, with a little legwork and outside help, high speed connectivity shouldn't pose too much of a problem. The amateur radio club here at my university has been able to get a 10mb ethernet connection to the campus network (which in turn has a T1 connection to the internet) for less than $20/month. Numerous other universities provide similar deals. And working under the banner of community service should help you line up deals with other organizations.

>Cable companies, telephone companies, and others are all working to
>provide affordable, practical connectivity of greater bandwidth than

>POTS. When available, the roles of "provider" and "consumer" may
>change drastically. The possibilities are quite intriguing, anyway!

Unfortunately most of what I've seen coming from this end of the
connectivity department is focused on client like internet access. (no
servers) They're networks aren't designed with servers in mind and most
companies offering these services to the home aren't to friendly to the
idea of you running a server of any type.

>OBTW, this is just a quick email note, but I am interested in possibly
>"publishing" a more complete and researched discussion of the above
>issues. If you are aware of references, I'm interested! Or, if you
>have any comments, I'm very interested!

Well we certainly need it. With the amount of hostility and personal
opinion that this issue can generate, a good fact based resource would be
most welcome by me.

I bid just under regular retail for an Edison Cygnet
Horn, only to find it relisted the next day saying that the
top bidder withdrew. I wrote immediately and agreed on a
price with the lister, for almost the highest amount, and
sent my check immediately. He held it 3 weeks and returned
the check, saying that the top bidder had decided to buy.
Right. He just found another buyer who paid more than he
had agreed to sell it to me for.

IMHP - it's what the traffic will bear. Some prices are very high but there always seem to be buyers willing to pay. Some prices are reasonable, like the scanner and receiver I just auctioned off. I got several bids for each but not more than I really thought the items were worth if I were the bidder. On the other hand, I bid on a scanner and was outbid by about double. I didn't think it was worth what soemone finally paid, but who's to say. I eventually bought that item at RS for even less then I was going to pay if I had been the high bidder. Go figure!
It's fun to "shop" Ebay and see what's going for what price. And you never know, your bid may be the high one.

>ebay are outrageous?

I think (1) there are a lot of collectors hoarding things they can't really use, expecting a stock market crash on 1-1-Y2k and wanting swappables; (2) a lot of con merchants are pretending that beer mats are valuable; (3) a lot of people finally convince their insurers by auctioning a valuable back to themselves; but they have to place an outrageous Reserve in order to do that without any risk of selling.

All of this makes for many outrageous prices not only on eBay.

OK, sounds good to me. I have a 10Mbps connection at my university, an assortment of packet hardware...where do I go from here? I just happen to have a 56Kbps WA4DSY RF modem as well (just one, and no transverter yet). I *also* have 2 of the old BNC type of ethernet card that perhaps I could plug into a 10Ghz tranceiver system (got the pair for $4). I still need some microwave hardware and the other another end to my 56K link. I have already managed to get 1200bps internet access by an ingenious little TNC/modem connection but that was just something interesting and not really useful because it was unstable and temperamental. I really don't know much about what I'm trying to do other than the fact that I seem to have at least 50% of all the necessary hardware already. what's next?

Hi,
I have been looking for a site that has descriptions of electronic test equipment by manufacture and model numbers. It is nice to know that a XYZ 4582 scope is selling for $200, but what are the specs of such a critter? I can find all the new stuff at the manufacturer's site, but that doesn't help for the used stuff that I can afford!
Any ideas?

Aren't ALL auctions? The whole concept is a bunch of people competing
to see who can pay the MOST for an item. It would be silly to expect a
LOW price from an auction.

For some folks, Ebay prices are a bargain and
a chance to find sets they may otherwise never
run across. There are some isolated areas where
one doesn't have the opportunity to attend shows or
auctions to find this stuff. I have found a few radios
(well, one anyways) that I had been searching for,
and got it at the going market rate.

The trick is to set a price in your mind, bid it,
stick to it, and hope for the best.

Pete

SF Bay Area ??? are you Trolling ??? E-Bay has listings from
individuals all over the US and other parts of the world, they've
also just been named to officially take over AOL's classified
ads/buying/selling. As I mentioned earlier E-Bay _Doesn't_ sell
anything _Themselves_ , and they _DON'T_ set the prices, they merely
get a brokerage or percentage of the item's worth when it's sold as do
most _true_ auctioneers. I suspect it's folks ego's that cause such
high prices to be paid but you sure can't blame E-Bay for folks that
bid _more_ for items than you can buy them new for.

At last! Somebody who is interested in utilizing the full potential of an Inet/Pkt gateway!

Up to now, gateways have been used almost exclusively as a means to impose (cheap, dumb, easy) Internet connections as a substitute for communicating via Amateur Radio. - This is the reason they have been severley restricted and even outlawed in Europe, and are quickly gaining a poor reputation here in the USA. They have been used to "dumb down" amateur radio instead of lifting it up to a higher potential.

Misused as substitutes for Amateur Radio here in the USA, gateways have been associated with the severe decline of the packet network over the last decade. Where gateways have been restricted/outlawed, the packet net has advanced and grown in an uninterrupted fashion over that same span of time. (Europe)

The message is clear: Misuse an Inet/Pkt gateway and the packet network will suffer, every time.

Brian's idea of utilizing a gateway as an interface between the two networks takes us beyond expediency and takes the utilization of gateways to a better, higher level which is much more fitting for the amateur radio service. - By exploring these applications, we will be demonstrating the wisdom of not throwing the baby away with the bath water by outlawing the use of gateways, as other countries have done.

There is a world of information on the Internet which could legally, effectively be made available to Hams through local gateways, and there's a lot of info that Hams have to offer in return.

My contribution to the discussion: The suggestion that special web sites and ftp servers especially dedicated to use by Amateurs would eliminate most if not all of the legal hassles.

For example: Gateways could offer access to special sites which provide Callbook info, propagation info, current keps, weather info, radio mods, you name it. All of these would be available to all gateways, and all of the info there would be pre-screened for suitability over the radio.

Hams, on the other hand, could also PROVIDE new info to special web sites through local gateways: Weather/APRS data, health 'n welfare messages for non-hams during the course of an emergency, ARES/RACES info, and specialized info which is hard to gather any other way.

I think Brian's suggestion merits serious consideration.

How do they get around the registration part in order to bid? I just got burned on a telephone to the tune of $25.00. I was high bidder and sent my money order but never received the phone. E-bay had no valid address and the phone was disconnected. I have also been burned on other items..I bought a computer with 17" monitor and the monitor crapped out after two days. The seller said I must have changed something and would not make good. I have had others, but those were the worst. I would say 70% good and 30% bad. I have bought items very cheap and sold items very high (much to my suprise) so I guess it is a crap shoot. A lot of people actually run their businesses on E-bay. I wish there was a way to tell who is a private party selling an item and who is a business. I think that makes a difference.

Brian,

Thanks for your post. This is a sublect very interesting to me. My main interest in the immediate future is for remote email access but all the other web features would be benficial as well. What I'd like to see is a Linux server, and the client end able to use Windows 95/98/NT client email or web browser software.

Please keep me posted on developments, and how I may be able to help.

WOW!!! a XYZ 4582 for only $200!! what a steal!! ROFL! Seriously, if
you don't know the equipment specs or don't know someone who knows them,
look for old test equipment catalogs or get catalogs from used test
equipment sellers that have good descriptions of their products (some may
even have their own web pages). Electronic engineering companies may have
some in technical libraries or try cultivating some contacts in the
calibration lab, if you can, since it looks like you may not be employed in
the electronics industry. I believe I saw a test equipment NG also. It
won't help for garage sales and swap meets, but you can get info on specs on
advertised test equipment.

>At last!&#65533; Somebody who is interested in utilizing the full potential
>of an Inet/Pkt gateway!

I was not thinking of internet/packet gateways at all, actually.

I appreciate your comments, but these are not my ideas.&#65533; I was thinking
more of audio and video from amateur radio provided through internet
servers.

There are an abundance of FTP sites and email flows pretty freely through
various mailing list servers, in addition to private email.&#65533; File
transfer and message forwarding were two of the big uses for packet.

My thought is to accomplish more unique and innovative goals, like making
live ATV from around the world available as simply as changing a channel,
or listening to repeaters around the world just as simply.&#65533; Or making
club or organization "nets" available on the internet.

In any case, removing unnecessary regulations on what may be transmitted
especially in our underutilized UHF/microwave bands is a worthy goal
IMHO.

Don, there IS a place.

It is kind of strange but the BOB DUCKWORTH's APACHE AUCTION SITE
has sold a number of things at VERY VERY low prices.

I have found it is a great place to unload stuff I don't need and give someone
a bargain at the same time. There is NO FEE there!

eBAY is getting rich off the sales of things at highly inflated prices. Their
comminssions are huge for something that doesn't cost them much to operate.

Try the DUCKWORTH-APACHE auction site next time!

Go to -
http://www.atl.org/wits/

and then click on Auction.

Some of the cattegories have bizarre sounding names, but I have found some great
deals on radio gear and computer items there! ALso sold a few bits and pieces.

It is nowhere near as big as eBay, but it is FREE!

No. You just haven't been listening to the entire discussion. High-speed
Local loop is an enabling concept as you discuss further down in this message,
not just a connection to someplace else.

>Misused as substitutes for Amateur Radio here in the USA, gateways have been
>associated with the severe decline of the packet network over the last

>The message is clear: Misuse an Inet/Pkt gateway and the packet network will
>suffer, every time.

We still disagree on the issue regarding why BBS operations and even user 1200b
ax.25 declined. Gateways were not responsible for this trend. Gateways to the
Internet were an attempt by a few to try to do something new and exciting and
learning for them. More to the issue was the lack of change over a sustained
period of time that led to many leaving the aspect of BBS operations to do
something else. This fact was a main factor for users moving on to other
pursuits after the same period of time. The lack of change over time combined
with the same type of information technologies being introduced into the
consumer market at a much faster rate with the same underlying concept was the
greater factor in the decline as you see it.

>Brian's idea of utilizing a gateway as an interface between the two networks

This is a real turn for you Charles. Congratulations. Although, wouldn't using an Internet connection in any way under your previous definition make you a LandLine Lid ? I am more than happy if you can drop all the nonsense of labeling and get back to the point of what makes us amateur radio operators what they are -- that of communications using radios in some manner that allows people to either learn new things or increase their technical ability.

>My contribution to the discussion: The suggestion that special web sites and
>ftp servers especially dedicated to use by Amateurs would eliminate most if
>not all of the legal hassles.

>For example: Gateways could offer access to special sites which provide

>name it. All of these would be available to all gateways, and all of the
>info there would be pre-screened for suitability over the radio.

Sounds like what is already on many sites. But the issue here is why differentiate between a phone repeater and a digital gateway ? The FCC made a mistake when they ruled several years ago on the unattended operations issues with regards to a BBS. We have a chance now to correct that rule by commenting it on it during this current rules rewrite. Although this is another issue off the topic....

What keeps a repeater phone patch user from calling a 900 sex line or some other number that would be inappropriate for the usage. Nothing, except for the fact that we are amateur radio operators hopefully living within the rules. If you try to make things so that it keeps the less than .01% of the population from doing something, then you are never ahead of the curve. You spend to much time worrying about what shouldn't be done instead of what needs to be accomplished to allow the greater aspect of the population to thrive. We have to accept that as individuals we make the correct choices. When and if someone does break the rules, there are methods to take care of the problem in the rules and socially within amateur radio itself. A digital gateway to the Internet is the same as a phone patch to a repeater. It allows an amateur access to additional resources that are hopefully used in a positive and empowering manner.

Why limit access on an interface to a set of what people might think is appropriate to amateur radio. What about haz-mat information ? or weather.com for weather information ? or the FCC database for rules and rule changes ? or the Newsline audio on TAPR.ORG ? or the ARRL Audio news on the ARRL.ORG ? or any number of ever changing sites available once you get a connection going. I could go on for a long time. If we try to limit the access of information to a know set of data, then we are really no better off than having what we had a few years ago with just BBS systems.

But I am not really worried. Change is happening. That is all that matters. People are working on new concepts and projects -- and that is why amateur radio is ever exciting as we continue to push forward with new technology that

will be enabling for digital communications within the amateur radio ranks.

>Hams, on the other hand, could also PROVIDE new info to special web sites

>
>I think Brian's suggestion merits serious consideration.
>

I agree.

These concepts have been around for sometime now.
Glad Brian's points have been received in this manner by you Charles.

Cheers - Greg

The BS170 may not be a direct equivalent but is certainly suitable for the
purpose.

3811. Need help with Magellan OEM 5000

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-13 00:00:00 UTC
From: Alessandro <ik5mic@amsat.org>
Message-ID: <6tipvb$s4$2@pisanino.unipi.it>
Source record: 22550

Hello,

I have just bought a Magellan OEM 5000 GPS unit for a few bucks at a recent flea-market.

It came boxed into an anti-burglar device originally designed to be installed into trucks: when stolen, the vehicle could be tracked via a cellular phone. Unfortunately the company who designed and assembled the device has gone into bankrupt recently...

The box was mint and wrapped, with a Matsushita active roof antenna enclosed.

After studying the main & GPS unit PCBs, the flat cable joining them, statically and with the supply applied, I succedeed in drawing a scheme for the supply requirements (+5V), backup battery and ground. Apart from not-connected pins, only three pins were left with a question mark.

The first one gives the same DC voltage as measured at +5V input, the second exactly 1V less, the third one has variable DC output (from 2 to 5V on my DMM).

Suspecting this last one as the serial output (sorry, I don't own a scope) I connected it to the serial port of my PC.
Funny characters started to fill the screen, and I wasn't able to find the right combination of speed/word lenght/parity.

Does anybody knows anything about the Magellan OEM 5000 unit? Any of similar Magellan OEM units?
Do you think I got the right pin for serial output? TTL instead of RS-232/422?
Which is the right combination of speed/word lenght/parity for the NMEA interface?

If you know the right answers, pleas drop me a few lines.

Best regards and... thank you.

Alessandro

Erik,
The PK-232/DSP has new filters for all the PK-232 modes, including
Amtor/Navtex. All the new filters are linear phase FIR filters.

The PK-232/DSP daughterboard is installed internally in the PK-232/PK-232MBX
and gets its power from the PK-232/PK-232MBX. It does not require an
additional external power supply.

73,

3816. Re: Feasibility of Internet Amateur Radio Servers - A Discussion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-14 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6tib5t$ctt@enews3.newsguy.com>
Source record: 22555

What some of Greg Jones' LandLine Lid buddies in Texas are up to:

TAPR's charter is set up the same way, from what I have been told. Something
for Hams to watch out for.
You can generally assume that my comments about TPRS all apply just as well
to TAPR, for this reason.

TPRS, (Texas Packet Radio society) has recently come out of the closet as
a Non-Ham organization. According to the TexNet network manager, N0CCW,
only the name has anything to do with Amateur Packet Radio. TPRS is not,
in fact, an Amateur Radio organization no matter what it's name may imply.

It's ironic but true that if you want to support Amateur Packet Radio in
Texas, The "Texas Packet Radio Society" is the very last place you should
consider sending your money. They are not interested in building an Amateur
Packet Radio network at all.

Take a look at the May '98 issue of TPRS's "Q-Report" to see what I mean..
No mention of packet radio, except how it's somehow just not good enough..
The bulk of the newsletter is dedicated to the "great challenge" of
abandoning Amateur Radio so that all of TexNet's nodes can be linked to each
other by the Internet instead. - Along with an implication that in the near
future, TexNet nodes without good *Internet* connections will be
phased out of the network altogether. I know that many of the TexNet
node-ops are real Hams, and these appear to be the ones TPRS intends to
edge out.

Organized gutless quitters... That's not the kind of people I would care to
be associated with. I'd rather work with Hams. - Real Hams who want to see
Amateur Packet Radio advance and grow.
A few members of the isolated, insulated little clique that has controlled
TPRS since it started are of a mighty high opinion of themselves.. They
appear to believe that if THEY cannot figure out how to surmount a problem,
then of course nobody else ever will or could either, and the best policy
is to "be realistic" and give up on Amateur Radio right now, in an
organised fashion.

In fact, most of the innovation and industry recently associated with the
Texas Packet Radio Society appears to have been in that direction; Leading
Hams to abandon Amateur Packet Radio networking in favor of developing a
dependence upon Non-Ham means of communications... Harry was giving
us the straight scoop when he said that TPRS is not an Amateur Packet Radio
organization... In fact, it appears to be the exact opposite.

This is why roughly half (over 1000 miles) of the current Texas TexNet "Packet Radio Network" is actually donated wireline links. They claim to be the biggest Amateur Packet Radio network... Well, remove the 1000 miles+ of Non-Ham links and all of a sudden they are running a distant fourth place. Still impressive, but not for long if TPRS's newsletter can be believed. They appear to be ready to deliberately phase out the use of Amateur Packet Radio very soon, and they call that "progress".. ?? ! ??
I guess it may be "progress" for the isolated/insulated TPRS clique, but it sure isn't good news for Amateur Radio.

Simulated "packet radio" networking using Non-Ham means of communication only serves to displace and replace genuine Amateur Radio networking efforts.
The president of TPRS, Tom McDermott N5EG, does not appear to be content with the speed at which the packet net in the U.S. is being damaged in this way by Non-Ham links, and is doing what he can to accelerate the process. What a guy.

When the Hams in Texas decide they would like to initiate a new, REAL "Texas Packet Radio Society", which clearly states in it's charter that the organization is dedicated solely to advancing Amateur Packet Radio, I will be glad to participate. Those of you who have wondered what happened to the TPRS Q-Report lately should know that I am no longer editor. That's why it's tiny and dull now. For a REAL "TPRS", I would be glad to edit the newsletter,
and handle most of the Internet stuff as well. (Web site, graphics, ect.)

TPRS's charter does not call for dedication to Amateur Packet Radio. It is a "digital communications hobbyist" organization instead, which explains why TPRS has had no problem in turning against Texas hams, working to destroy
Amateur Packet Radio networking in Texas, and replacing it with an utter dependence upon Non-Ham means of communication. (Internet, Wirelines, ect..)

I have too much personal pride as a ham to associate myself with a Non-Ham organization like TPRS, or the "Non-Hams" who run it. When I want to use the Internet, I dial up my ISP. When I want to utilize Amateur Packet Radio, I use radios. I will not associate myself with persons who cannot comprehend that simple distinction, and who show no respect for Amateur Radio and their fellow hams.
Destructive "packet hackers", out to denigrate and destroy the work of decent
hams to build a Packet RADIO Network should not be given the respect which a decent ham deserves, just because they may happen to hold a Ham ticket... A thief with a Ham ticket goes to jail, a drunk with a Ham ticket loses his driving license.. There is no reason to hesitate to deal with "packet hackers" either, just because they have callsigns.

I am a Ham Radio Operator, and not a "digital communications hobbyist", so it
would be a waste of my time (not to mention the slur on my character) if I were to participate in the activities of TPRS.

For TexNet node-ops who would like to retain their pride as hams in the coming years, I would suggest that the NCP board will make a fine wall-hanger
and may someday have collector's value.
In the meantime, PC-FlexNet will provide you with Packet Radio networking features at least a decade in advance of TexNet, and you'll still be able to "talk" to TexNet nodes over the "backbone"(through a BPQ node). You'll still be providing a path (transparent) for TexNet networking (if you wish to) and will be helping to provide many additional capabilities to the network as other FlexNet nodes appear. See my web page or contact me via packet for additional info on FlexNet.

Overall, FlexNet may be the best solution for Hams who wish to counter the effort by TPRS to shut down Amateur Packet Radio networking in Texas.

My suggestions:

(1) Since we don't have a state-wide Amateur Packet Radio organization, perhaps it's time we did! Any suggestions or volunteers?

(2) Look at FlexNet, if you are currently using or thinking of using TexNet. It's much better, and requires no "network manager".

(3) Quit supporting TPRS, now that it's aims and policies are out in the open
for all to see. Again, I'll refer you to the May '98 issue of the TPRS Quarterly Report. Any TPRS member will have a copy. Look it over, and you'll quickly see what I mean. If you are interested in Amateur Packet Radio networking, TPRS is no longer a viable place to direct your support. They will actually take your money and work against you.

Thanks for taking the time to look and think this over.

Charles Brabham, N5PVL

>
>No. You just haven't been listening to the entire discussion. High-speed
>Local loop is an enabling concept as you discuss further down in this
message,
>not just a connection to someplace else.

I haven't said anything, one way or another, about high-speed local loops
except that I'd hate for my digital ham radio activities to be limitied to
one.

GATEWAYS, though, as I mentioned, are almost exclusively utilized as a
cheap, dumb way to avoid using radio to communicate. The "connection to
someplace else" you mention above is not the local loop, it's the gateway.
The local loop will only get you - the local loop. The typical insulated,
isolated TCPIP LAN has but one connection to the outside world, and that
connection (the gateway) has absolutely nothing to do with amateur radio.

Why is it that you are having trouble differentiating between the two, I
wonder?

I've noticed that many of your statements, Greg, appear to be semantically
null. Like our great president, you appear to specialize in using a lot of
words to say absolutely nothing, or to say one thing while appearing to say
another. The main difference being that you are not nearly as good at it as
"Sick Willy". - And he's not as good at it as he would like to think.

>>Misused as substitutes for Amateur Radio here in the USA, gateways have

>>suffer, every time.
>
>We still disagree on the issue regarding why BBS operations and even user
1200b
>ax.25 declined. Gateways were not responsible for this trend.

Yes, we disagree. Lots of other hams disagree with you as well. Most of
those are BBS SYSOPS, who are in a much better position to judge such
matters than you are, or ever will be. You don't have a clue, Greg, about
the Ham digital network and what goes on within it. You never have.

>Gateways to the
>Internet were an attempt by a few to try to do something new and exciting
and
>learning for them.

English 101, anybody?

>More to the issue was the lack of change over a sustained
>period of time that led to many leaving the aspect of BBS operations to do
>something else.

More to the point, a group of nihilistic "packet hackers" undermined and
undercut the efforts of thousands of hams across the world with "Internet
Forwarding", and then offered NOTHING in return except the shame of "Amateur
Telephone".

The date that the packet net in the USA lost heart and enthusiasm matches
exactly with the date that "Internet Forwarders" such as F6CNB appeared to
flood the US packet net with an intolerable barrage of @WW bulls,
deliberately overloading the network so as to bring it to it's knees, and
replacing one HF forwarding route after another with "amateur Telephone".
Gateway abuse)

>This fact was a main factor for users moving on to other

>
>This is a real turn for you Charles. Congratulations.

You haven't been following the discussion, Greg. I've been saying this for years, now. Even back at tcp-group, not to mention the TAPR BBS-SIG. Congratrulations for finally noticing part of what I have been saying. And thanks to whoever explained it for you.

I object to the moronic, self-defeating practice of running using gateways as a substitute for radio, and always have.

I've never had any objection to positive, intelligent use of gateways, but haven't seen much evidence of your TCPIP buddies working on that angle. - They appear to have been too sucked up in the idea of "free internet access", and in using the Internet as a way to mask the serious deficiencies of TCPIP for wide-scale (global) digital RF networking. - The more responsible, intelligent uses for gateways never seemed to occur to them, which is why we have so few of those types of applications today.

Almost all the significant work in that direction has been done by the APRS folks, over the last few years. In over ten years, the amateur tcpip folks came up with pretty close to nothing along these lines.

>Although, wouldn't using
>an Internet connection in any way under your previous definition make you a
>LandLine Lid ?

My definition of a "LandLine Lid" is the same as it's always been: A "Ham" who uses non-ham communications in preference over amateur radio, due to cheapness, incompetence, or a desire to "hack" a network which no defense against such activity - the Amateur Packet Radio Net.
Internet Forwarders are "LandLine Lids", because their activities fit the above perfectly.
YOU are a "LandLine Lid", Greg, simply because of the work you have done over the years to denigrate and destroy the genuine packet radio network, and replace it's functions with bogus non-ham communications. Go ahead and try to weasel or lie about it. I don't mind quoting you.

>I am more than happy if you can drop all the nonsense of
>labeling and get back to the point of what makes us amateur radio operators
>what they are -- that of communications using radios in some manner that
allows
>people to either learn new things or increase their technical ability.

The "communicating with radios" part is just fine.. The "in some manner which ect ect" is a rationalization for Amateur Telephone, and nothing more.

Since you are a LandLine Lid, it is natural that you would be anxious to put some form of qualification on "communicating with radios".

How pathetic. How obvious.

>>My contribution to the discussion: The suggestion that special web sites and
>>ftp servers especially dedicated to use by Amateurs would eliminate most if
>>not all of the legal hassles.
>
>>For example: Gateways could offer access to special sites which provide
>>Callbook info, propagation info, current keps, weather info, radio mods, you
>>name it. All of these would be available to all gateways, and all of the
>>info there would be pre-screened for suitability over the radio.
>
>Sounds like what is already on many sites.

Yes, the APRS guys in particular.

>But the issue here is why
>differentiate between a phone repeater and a digital gateway ?

Why not? They are two very different things. Entirely different systems, not even remotely the same in how they are utilized. Only somebody who is interested in muddying the waters and attempting to hoodwink people would have any reason to put them forward as being the same thing.

> The FCC made a
>mistake when they ruled several years ago on the unattended operations issues
>with regards to a BBS. We have a chance now to correct that rule by commenting
>it on it during this current rules rewrite. Although this is another issue off
>the topic....

Not really. You're wanting an "anything goes" content rule to the high bands. I saw a picture in QST recently of three little girls, all under 6 years of age, who have just gotten their ham tickets. Which one of these little girls, Greg, would you rather have looking at pornography ads on Amateur Packet Radio? Hmmm?
With the recent migration away from the TAPR SIGS due to those nasty ads getting in there, don't bother trying to fool people into thinking your "anything goes" suggestion would not quickly drag Amateur Packet Radio down to the same sorry level as the TAPR SIGS. - With the same results.

Your "anything goes" deal is another sicko attempt to prop up Amateur TCPIP, which is DEAD DEAD DEAD without "Amateur Telephone", and the promise of "free internet access".

By the way, I talked to the people at my ISP, and they didn't take too kindly to the idea of "packet radio hackers" who tell the ISP that a

proposed gateway is for public welfare and emergency communications, and
then go on to use it to undercut their business by "playing ISP", and
offering free access for general use, as opposed to ham-related uses.
I bet a lot of other ISP's will feel the same way, when they read my report.

>What keeps a repeater phone patch user from calling a 900 sex line or some
>other number that would be inappropriate for the usage. Nothing, except
for
>the fact that we are amateur radio operators hopefully living within the
rules.

- And the fact that they are heard by dozens if not hundreds of other hams
on a voice repeater. People do a lot of things over a keyboard which they
would never do "in person", and packet communications are not nearly as well
monitored as voice communications.
Get real.

> If you try to make things so that it keeps the less than .01% of the
>population from doing something, then you are never ahead of the curve.
You
>spend to much time worrying about what shouldn't be done instead of what
needs
>to be accomplished to allow the greater aspect of the population to thrive.
We
>have to accept that as individuals we make the correct choices. When and
if
>someone does break the rules, there are methods to take care of the problem
in
>the rules and socially within amateur radio itself. A digital gateway to
the
>Internet is the same as a phone patch to a repeater. It allows an amateur
>access to additional resources that are hopefully used in a positive and
>empowering manner.

So I take it that you have changed you position, and now condemn the
practice of "Internet Forwarding", and the use of Internet links by TCPIP
LANS to communicate with each other, instead of amateur radio?
Congratulations, Greg! That's a great step forward for you.

>
>Why limit access on an interface to a set of what people might think is
>appropriate to amateur radio.

Because you are interfacing it to Amateur Radio, stupid.

>What about haz-mat information ? or weather.com
>for weather information ? or the FCC database for rules and rule changes ?
or
>the Newsline audio on TAPR.ORG ? or the ARRL Audio news on the ARRL.ORG >?
or

How about those nasty porno ads that keep showing up on the TAPR SIGS?

Grow up, Greg.

>any number of ever changing sites available once you get a connection
going. I
>could go on for a long time. If we try to limit the access of information
to a
>know set of data, then we are really no better off than having what we had
a
>few years ago with just BBS systems.

And no worse.. I can see that you do not comprehend why Hams MUST limit the sort of information we move in our network. Keeping filth and advertisements out of the Ham Radio has worked great up to now, Greg, and I don't think you will have much luck making a case for them now.

In fact, I have not heard a single case where "anything goes" access would provide anything *relevant to amateur radio* which cannot be provided just as efficiently with a properly supervised operation.
The regulations concerning content are there precisely to ensure that some effort is made to do so.

Amateur Radio is not here to provide competition for ISP's, or with any other commercial communications service.

>
>But I am not really worried. Change is happening. That is all that
matters.

Semantic content: Null.

>People are working on new concepts and projects -- and that is why amateur
>radio is ever exciting as we continue to push forward with new technology
that
>will be enabling for digital communications within the amateur radio ranks.

Greg, are you on some kind of medication, or does the above really reflect your "thinking processes"?
If you're not on drugs, maybe you should be, OM. At the very least, you should make some effort to learn what the words you use mean, and how to use them. Give us a break!

From: "Greg Jones", WD5IVD <wd5ivd@tapr.org>
Message-ID: <6tip6bvoe1@hornet.fibr.net>
Source record: 22557

I guess your position hasn't changed that much. You would rather continue to practice a trend towards exclusion based on your view of the world.

You continue to call for the creation of another digital group in Texas or another nationally. Why don't you start it instead of wasting time calling for the creation of something and commenting on how bad all the rest us are doing. Why not spend your energies building and creating instead of just writing about the future you would like to see and how much harm all the rest of us are doing to amateur radio.

Is it possible that you either lack the ability of leadership or are just to lazy to actually do the necessary activity to build a functioning group ? To build the network you continue to talk about now for over three years without building ? To generate an organization that works towards improving amateur radio as a whole with activity instead of just posting negative tripe.

I challenge you to do it Charles. Build something. Anything.

Just shut up about how bad everyone else is and step out front yourself.

It is bad enough that I have to continue to have to listen to your negative statements about how bad we are all doing or how wrong we all are when this is all suppose to be fun. Why not join us at the edge and see how you can do. Be a leader Charles, not just a rabble rouser. Not just a pilot fish. Not just a fringe element. Time to gather this mass of people you believe are out there to create an organization that will eclipse TAPR, TPRS, NEDA, AMSAT, or the ARRL in what you do. Time to move forward to greatness Charles. Can you do it ?

Time to walk the walk. We know you can type it.

Stop being Baby Huey and move forward in your life and be proactive about change and getting it done instead of anti-active towards everyone else.

Until you actually start doing things for yourself, you will never affect change as you see it should be done. Your words on USENET and on packet radio don't really hurt me or the organizations I am involved in. While a few people read your negative messages about various efforts, membership continues to increase each year and I'll continue to be president of TAPR while the Board of Directors feel that I can carry out the policies we set forth as a board. So, until you get off your lazy butt and do something other than write, your impact will be what it has been to date. Not very much.

Your words haven't slowed me down one little bit about how I see things should be moving. I continue to move in the directions I help set back in 1991 when I took over at TAPR. The goals I presented to the TAPR Board then haven't changed much. The main goal has always been to increase user access speed and

connectivity at a price point were we see networking growth once again. That this growth once again builds a community of networks. The other being to always do interesting projects that keep amateurs radio operators in the forefront of experimenting and technical advancement. The various projects with DSP, GPS (http://www.tapr.org/gps), and Spread Spectrum (http://www.tapr.org/ss) technology that TAPR has done all fit into this goal. I don't spend my time designing all these things that lots of amateurs play and experiment with. I spend my time organizing and making sure that others pool their talents when possible to pull off these unique projects.

Can you do anything that is positive in nature or would your organization be one of these groups that has a mission statement that is based on making sure you oppose some other group ? A mission statement that is a negative one instead of a positive one. The challenge has been made. Can you do it Charles ?

Time will tell.

For me, time is drawing near on several major projects that were started over the past few years. The bootable FlashCard for Linux operations will be announced at the DCC with the alpha units shown. This will allow anyone to have a working Linux system with no harddrive or floppy. Configuration should also be very easy. Add a good power supply and you have a node that can be placed in hostile environments...like a lot of our current nodes. The TAPR 900Mhz Spread Spectrum radio digital board is debugged and working and the stack code (which will be public domain when completed) has been ported to the test platform and is being ported now to the operational TAPR board. If the team has the time before the DCC, it might get shown at the conference (http://www.tapr.org/dcc). That leaves the RF section to be completed past the current working VCOs and then we can start a national Beta testing (http://www.tapr.org/ss) phase. The TALNET router/radio (169Kbps DSS radios) that we have an agreement with to make available will be shown at the DCC and hopefully we can get the room full of units into people hands to experiment with by the end of the year.

I help others shape the future of amateur digital communications by enabling them to get projects completed or find direction. Can you do the same Charles ? or will we be reading more about this instead of seeing actual deeds.

Cheers - Greg

3819. Re: Feasibility of Internet Amateur Radio Servers - A Discussion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-14 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <6tio6d$jqi@enews2.newsguy.com>
Source record: 22558

Ever wonder exactly HOW the packet net in the USA was destroyed by
LandLine Lids so quickly and efficiently? Here's how:

Prior to the existence of Internet Gateways and Internet Forwarding of
Amateur Packet Radio messages, the "system" only had a small number of
"@WW" bulletins to move, and was quite capable of handling that load. There
was a bit of overloading, but nothing like today. There was just enough of
an overload to stimulate growth.

In those times of unlimited growth and potential, the "@ALLUS bulletin glut"
was a matter of contention among some SYSOPs.

Then a few Internet Forwarders set up their Non-Ham stations and lo and
behold! The number of @WW bulletins grew by several orders of magnitude,
literally overnight, then did so again... Since then and right up to this
day,
over 80 percent of all bulletins I receive are addressed @WW.
This is what undermined our packet net in the USA.

Remember what happened to AOL, when they suddenly offered unlimited Internet
access and they ended up with lots of new customers, while ALL customers
naturally tended to stay online much longer than before?
(Lots of BUSY signals from AOL)

Gee, I wonder why the Ham Radio (RF) net can't handle the @WW bulletin load
anymore? Gee, did you ever wonder why so much of the @WW stuff is lengthy,
trivial junk these days, that hardly anybody bothers to look at? Gee, I
wonder why the Packet net doesn't PERFORM as well as it used to?
What brought on this decline?
--
That glut is a direct result of Internet Forwarding. Shut down the LandLine
Lids, like they have done in most of Europe, and you will begin to discover
just how impressive Amateur Packet Radio can be.

Think about it. The LandLine Lid BBS message glut also has a lot to do
with the VHF/UHF nets being overloaded. The BBS operators and NodeOps
aren't the only ones suffering because of the irresponsible actions of
Internet Forwarders.

Keyboarders can also thank those same idiots for choking up our VHF/UHF
networks with tons of unwanted crud, making it difficult to maintain a
decent QSO over any significant distance.
Prior to Internet Forwarding and the @WW glut it brought down upon us all, I
remember being able to QSO at least briefly for over 500 miles, over **
NetRom ** nodes. Now it's hard to do the same over the much faster TexNet
network at times.

There is a growing community of BBS SYSOPs now who routinely Zap any messages which have not traveled the entire distance by means of Amateur Radio. Yep, they are killing bulletins which have gone through Internet Forwarders, in an effort to re-establish a genuine, functioning Amateur Packet Radio network. I have not joined in with those guys, but maybe someday I will. If I do, I bet I'll end up Zapping an awful lot of @WW bulletins, and you do not pass on, display or forward what you Zap.

Check it out for yourself. The bulletin glut is the direct result of the introduction of Non-Ham links into an Amateur Packet Radio network.

Internet Forwarders are directly responsible for the current poor state of the packet net in the USA.

They have all been politely asked on many occasions to stop damaging the packet net. That approach has been proven to be ineffective...

You continue to say this Charles, but you have no proof other than analogy. Can you prove it ?

Isn't this really because the amateur community by having gateways now regularly post to WW instead of more appropriate routes. They don't care if it goes everywhere. This is an end user issue, not a gateway issue. The gatway just enables them to do it. Turn off gateways and yes you fix the user problem, but isn't that problem better fixed by education of the user base ? Don't fire the coach, just train the players better.

You state 80%, but what is the regional breakdown of those message ? Just because you are getting 80% of messages @ww that doesn't mean that it is a bad thing. It just means that is the route people are addressing to.

When I was in England in 1990-91, every bulletin the BBS I was operating handled seemed to be @WW messages. Very few people seemed to use regional routing. The issue being then people wanted to get all of Europe and where else it might go didn't really matter it seemed.

Could it be that simple end user learning just followed the message routing they typically saw on a day to day basis, instead of either learning the correct method or getting taught by a BBS sysop.

This is one of the most appropriate and on-target comments about eBay,
and auctions in general, that I've ever read.

One kind of item for which eBay has actually improved the auction process
is phonograph records. The customary way for auctioning them has been
for the seller to send lists in the mail, and bidders submit their bid.
It's not a highest bid with a proxy system like eBay--what you bid is
what you bid. You never know if you're bidding high enough or not until
it's over. And you don't know if you're bidding way too high or not.
eBay has actually improved the auction process in this one regard.

And you never know who you're bidding against.... Even if it's the original seller..shilling.

I know of at least one case in the RADIO arena where eBay found a man using multiple accounts to shill and booted him off...errr, well...almost. Many of us are sure he's still selling and probably shilling under another name. eBay now will do little about it!

wireless....

>>
>
>You continue to say this Charles, but you have no proof other than analogy.
>Can you prove it ?

I suppose I could if I wanted to, but to be honest, it's not worth the
effort to do so. The people who really count were actually involved in
moving those messages through their BBS's and know exactly what I am talking
about. In fact, I have recieved messages from SYSOPs around the world
verifying that it was not just a "thing" local to Texas, but a drag on
amateur radio digital networking worldwide.

Are you asserting that you are too ignorant to comprehend the comparasin I
made to AOL's troubles? If so, be sure that you are in a tiny minority.

And as I have also mentioned several times, previous to F6CNB's LandLine Lid
station being set up in Houston, it was quite normal to see packet messages
moving back and forth between Texas and Florida via Amateur Packet Radio. -
Since Remi set up his Internet link to Brian Lantz's LandLine Lid station, I
have not seen ONE message forwarded from Florida to Texas via Ham Radio in
several years. I'm sure you don't see any problem with that at all, do you?

>
>Isn't this really because the amateur community by having gateways now
>regularly post to WW instead of more appropriate routes.

No. The @WW glut appeared within a few days of the appearence of those
"stations". It was very sudden, as such changes go. The glut did not come as
a result of Hams gradually adjusting to the gateways.

Where do you get these ignorant, unrealistic rationalizations, Greg? A poor
imagination?

>They don't care if it goes everywhere. This is an end user issue, not a
gateway issue. The gatway
>just enables them to do it. Turn off gateways and yes you fix the user

>problem, but isn't that problem better fixed by education of the user base
?

No. It's a problem better fixed by using radios. You know, like the "Ham
Radio operators" use?

>Don't fire the coach, just train the players better.

That's right you jerk... Blame it all on "Joe Ham". How typical a reaction
to see from a LandLine Lid.

>
>You state 80%, but what is the regional breakdown of those message ? Just
>because you are getting 80% of messages @ww that doesn't mean that it is a
bad
>thing. It just means that is the route people are addressing to.

I think it really means that you are grasping at straws because you are
desperate not to face the truth about what you have been promoting, and the
damage it has done to Amateur Radio.

Go ahead, split hairs, Greg. Anything but face the truth, Mr. Clinton -- I
mean Mr. Jones.

Weasel away. ;-)

I agree that it is a sellers paradise there. Once in a great while you
can catch the bidders off guard as I did when I bought a radio from there. I
actually paid about the right price or maybe a little less considering he
also had about $150+ in accessories. The nice thing about ebay is that you
can check the sellers track record (if he does a lot of business on ebay).
This is a very nice feature that set me a bit more at ease. I was very
satisfied with that particular deal.

<6tnape$m8c$1@node17.cwnet.frontiernet.net>...
>
>I was reading the comments by Greg Jones and he is right on the money when
>it comes to the demise of packet radio on amateur radio.

Everybody is entitled to an opinion.. I think Greg's full of farina, and knows next to nothing about the genuine Ham Radio digital network.

>
>Those of us who wanted to help digital networking grow sure did have a lot
>of detractors though. Primary opposition seemed to come from some BBS Ops
>who had a tremendous concern for protecting their power base.

Rick heard somebody say this, somewhere, and went on to parrot the phrase here without bothering to examine it for accuracy. I see a lot of that among the LandLine Lid types.. They always parrot the same hackneyed propaganda phrases verbatim, lacking the imagination, I suppose, to vary the delivery from time to time.

If you are talking about BBS SYSOPs opposing "Amateur Telephone", Rick, you are right. If you are saying that they have opposed Ham Radio networking, you are not only wrong, but you are also rather ill-informed.

BBS SYSOPs built most of the network in the first place, and expanded it to global proportions.

>
>And the cost was too high they told me for the average ham to get involved
>in our area at least for "high speed" 9k6 packet much less 56K.

That's right. High-Speed packet may have a bright future, but it has had a really sorry past and looks not much better today. It is monumentally ignorant and arrogant to expect the average Ham to go through all the "crud" involved in high-speed packet, just so they can experience the dubious "joy" of utilizing the third-rate imitation of the Internet which is the utmost that amateur tcpip can ever hope to accomplish.

Most Hams have too much sense to spend that much money, and go through that much effort, for that sorry a return. Who can blame them?

When I want to "do" the Internet, I dial up my ISP and do the real thing. To heck with "simulated Internet", and "simulated packet radio networking", and all the other bogus crud you LandLine Lids types get so excited over. It all looks like crap to me, Rick. I'll stick with the real thing, thank you. Real Internet, and Real Ham Radio.

>
>As I predicted many years ago, if we did not act quickly to access the
>internet and use its strong points with ham radios complementary strong
>points, we would be preempted by the internet.

You were right. What the Amateur TCPIP community did instead was to denigrate and undermine Ham Radio's strong points while ignoring most of what the Internet really had to offer Ham Radio at the same time. The clowns were so busy trying to "hack" the genuine packet net with Internet Forwarding and being destructive, negative jerks that they accomplished virtually NOTHING worthwhile. They were too busy attempting to denigrate and tear down the work of their betters to do anything worthwhile.

If they hadn't been such arrogant jerks and had done as you suggested, things would have been different.

But they were (and are) arrogant jerks.

>
>And we are now pre-empted by the internet. We are having this discussion
not
>on ham radio.....but on the internet.

Yep, that's right. Thanks a lot, LandLine Lid.

By the way, this discussion is also being carried on within the genuine Ham Radio digital net, where you can get the postings through the LandLine Lid stations without them being censored.

>
>I really see ham radio slowly becoming more and more irrelevant to
potential
>new entrants and it will be mostly vhf family communications like our
family
>does, or just a few older males mostly as in the past doing hobby things
>like contesting, dxing, rag chewing. Nothing wrong with that but there will
>not be a lot of new technology coming into ham radio that will allow it to
>do new things in new ways.

That's a crock of horse-pucky OM. Typical nihilistic, negative LandLine Lid propaganda, parroted verbatim from the "party line" ...

That's why I often use the phrase "intellectually and morally bankrupt" when describing the behaviour of LandLine Lids. I haven't seen an original, considerate thought come from one of them yet.

Yep, that's the kind of scum which have been screwing up the packet net in the USA... LandLine Lids.

I'm a Ham and proud of it. Take your telephone and shove it.

: This is what undermined our packet net in the USA.

A few observations:

How large percentage of the world ham population are US hams ?
How large percentage of the world ham population are hams in your
state ? How large percentage of the world ham population are hams in
your local community ?

So from those figures that 20 % of the bulletins are non-WW bulletins,
which in fact indicate a quite active local packet community, for
which I congratulate you.

The fact that the ratio between WW bulletins and local bulletins were
previously very different, would suggest that only a low percentage of
bulletins intended for world wide consumption actually reached your
part of the world. So if the bulletin penetration is improved by
satellite links, HF forwarding, Internet bulletin tunneling or
couriers carrying floppy disks (or Zip disks today :-) etc. is, in
your opinion, a bad thing ?

So if a ham wants e.g. help with some exotic gear and wants her/his
requests to reach everyone who might be able to answer it and you just
think it is just a good thing that the request simply dies out (which
it did previously) and did not reach you to bother you ?

With a large amount of data it is very important that the end user can
easily concentrate on topics the user is interested in and in this
respect the packet radio BBSs or even the Internet News is not doing
that job quite well in all situations. Trying to solve a problem,
which is a user interface problem, by randomly dropping bulletins
(intentionally or due to malfunction), in order to get the data flow
to a more manageable size, is not a solution to the original problem.

Hi all, and thanks for reading this.

The Southside Amateur Radio Society web site has just been updated, new features include:-

The September Newsletter (down loadable),

The makings of a VK stolen equipment page

Updated member list with Email and personal web pages.

Updated links page (small but growing)

And of course the 1 kW linear project by VK4YE.

We hope to make this a premier site with good content so please pay us a visit and tell us what you think... just leave us a note in our guest book. The Web address appears below.

Is it possible, that the rest of the world used @WW bulletins more
frequently than your systems and once the transfer capacity and
reliability increased, more and more of these @WW ended up at your
shores ?

Or are you saying that the forwarding stations are collecting any
bulletin they could ever get their hands on (even if addressed to a
local group) and forge the address in these bulletins to @WW before
forwarding them back to the packet net ? If that is the case, do you
have any proof of this ?

Could you please clarify these points.

Your chances of looking up that sort of information is as good as mine, OM.

By the barrage-like "tone" of your paragraph above, I take it that you are attempting to be intimidating and asinine.

You succeded in being asinine, but that's about as far as it went. You've convinced me that if you are not a jerk, you most certainly have a strong ambition to take your best shot at it.

>
>So from those figures that 20 % of the bulletins are non-WW bulletins,
>which in fact indicate a quite active local packet community, for
>which I congratulate you.

Looks like another clumsy attempt on your part to be "clever" came out as "asinine" instead.

I suppose you could see @ALLUS as a "local packet community" if you were silly enough. For my part, I'm not even silly enough to consider @TEXAS to be "Local". I have relatives who live 650 miles away, but are also in Texas. It takes 11 1/2 hours to drive there.

When I think of "local", I tend to think of a 50 to 100 mile radius. Something like that.

I don't think of every single distribution beyond @WW as "the local packet community", and I doubt if any other rational Ham does either.

>
>The fact that the ratio between WW bulletins and local bulletins were

>couriers carrying floppy disks (or Zip disks today :-) etc. is, in
>your opinion, a bad thing ?

If throughput over the Ham Radio Digital Net is improved by means of Amateur Radio, then that's great.

If you substitute Non-Ham communications for Amateur Radio, for any purpose including a desire for more throughput, the action is self-destructive, short-sighted, and utterly moronic. The widespread use of Non-Ham links in the USA has undercut the integrity of the digital ham radio network there to the point where it's performance is a fraction of what it was even a few years ago.
I suppose you will not be "happy" until the same tradgedy has overtaken the Ham digital net in your country as well.

Stupid Jerk.

>So if a ham wants e.g. help with some exotic gear and wants her/his
>requests to reach everyone who might be able to answer it and you just
>think it is just a good thing that the request simply dies out (which
>it did previously) and did not reach you to bother you ?

That depends... If he wants his notice to go out over the Ham digital network, he should realize that the Internet does not guarantee delivery to anywhere on the planet, and neither does Amateur Radio.

Your unspoken assumption that Amateur Radio should deliver anywhere, at any speed, at any cost, even at the cost of damaging the network itself is typical of the self-centered, asinine jerk "reasoning" of the average LandLine Lid.

If our theoretical Ham is totally obsessed with his message being distributed as widely as possible, he might try distributing it on the Ham Digital RF net, the Internet, the local repeater, and the bulletin board at the local laundymat for all I care. - The point is that a "pressing need" for a particular bit of information to be widely distributed does not constitute a good reason to act in a destructive, ignorant manner. The integrity, growth, and development of the Ham Digital RF Net is more important than the delivery or non-delivery of any particular message.

>With a large amount of data it is very important that the end user can
>easily concentrate on topics the user is interested in and in this
>respect the packet radio BBSs or even the Internet News is not doing
>that job quite well in all situations.

True enough, but unrelated to the topic at hand.

>Trying to solve a problem,
>which is a user interface problem, by randomly dropping bulletins
>(intentionally or due to malfunction), in order to get the data flow
>to a more manageable size, is not a solution to the original problem.

It sure isn't, especially when the original problem has nothing to do with the user interface. The problem was
one of distribution, and giving up on Amateur Radio and utilizing Non-Ham means of communication was a lazy, stupid and characterless "solution" which has caused the network to halt it's previous growth and development, except of course in those areas where the Hams were clever enough to outlaw "Amateur Telephone" from their Amateur Radio digital nets and developed the use of radio instead.

It is no coincidence that those areas of the world which have outlawed "Amateur Telephone" are also those areas with the most advanced and well established Amateur Radio digital net on the planet, bar none. You can weasel, lie, rationalize, and make "clever" little asinine comments until the sun goes down, OM, and none of that will change the FACTS.

Amateur Telephone is a stupid, self-destructive and characterless way to bypass and avoid the challenge of Amateur Radio. Only the jerks, losers and self-centered clowns appear to be interested in it. That's all I need to know to understand that "Amateur Telephone" is a low-class, third-rate way to go. It's not good enough for Amateur Radio, and it's certainly not good enough for me.

I'm a Ham, and proud of it. Take your telephone and shove it.

Exactly. Now go back to my original post and read the part about AOL
again....

If the "transfer capacity and reliability" as you referred to it, had been
enhanced normally through development of the Amateur Radio digital net, the
@WW glut would never have occured, the US packet net would not have been
overloaded far beyond it's ability to adapt, and we would have a situation
in the US much closer to that in most of Europe instead of the current
degeneration.

But instead, we had the sudden, overwhelming @WW glut brought on by
ignorant, self-absorbed geeks who did not show any sense of responsibility
then and do not now.

LandLine Lids.

>

I've seen some of that go on as well, but see no reason to get my shorts in a bind over it. Such stations are identified and cut out of the loop, usually sooner than later. I've never seen one which was allowed to create problems for any great length of time.

>
>Could you please clarify these points.

Sure: You are a LandLine Lid, desperate to rationalize and weasel yourself out of admitting that what you have been involved in is stupid and destructive. Like President Clinton, you'd rather go on undercutting and undermining everything you stand for, rather than admit that you have been screwing up.

Don't feel as if I am picking on you... I have noticed a similar lack of character in many of your fellow LandLine Lids. It appears to go with the territory, just like pus goes with pimples. I hope you do not feel that you have been singled out when I point out your intellectual and moral bankruptcy as a LandLine Lid.

No hard feelings intended, just the facts.

>to say nothing of the high costs of even local phone calls, etc?
>(Why is is that so many offline newsreaders, etc. come from people
>who labor under PT&T communications monopolies?)

The details of why those folks were lucky enough to avoid "Amateur
Telephone" are really not of interest to me at this time . I will mention
though, that the use of gateways is ILLEGAL in those places, not just
expensive as you have pointed out. - Hams there saw the use of "Amateur
Telephone" as a disruptive, destructive and foolhardy policy to pursue, so
they legislated it out of their network. They made it illegal. -- And their
judgement on this matter has been borne out. They were right.

The result cannot be denied.

>Would
>the same thing have occurred if those countries had such a vast,
>well-connected, and extremely reliable wired communications system,
>like the U.S.A.? Things are not nearly as black-and-white as you make
>them out to be.

It's hard to say, Rich... Maybe they would have been trashed out by
irresponsible jerks with telephones too, and the FlexNet network would not
be here to prove that Hams who stick to Radios get things done, and Hams who
insist upon "Amateur Telephone" screw things up for everyone, including
themselves.

It's all academic though... The facts are the facts. We can play "what if
" forever, and nothing we conjecture about will change the facts.

3844. Re: Feasibility of Internet Amateur Radio Servers - A Discussion

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-15 00:00:00 UTC
From: Rick Williams <mrfarm@frontiernet.net>
Message-ID: <6tnape$m8c$1@node17.cwnet.frontiernet.net>
Source record: 22582

I was reading the comments by Greg Jones and he is right on the money when it comes to the demise of packet radio on amateur radio.

Those of us who wanted to help digital networking grow sure did have a lot of detractors though. Primary opposition seemed to come from some BBS Ops who had a tremendous concern for protecting their power base.

And the cost was too high they told me for the average ham to get involved in our area at least for "high speed" 9k6 packet much less 56K.

As I predicted many years ago, if we did not act quickly to access the internet and use its strong points with ham radios complementary strong points, we would be preempted by the internet.

And we are now pre-empted by the internet. We are having this discussion not on ham radio.....but on the internet.

I really see ham radio slowly becoming more and more irrelevant to potential new entrants and it will be mostly vhf family communications like our family does, or just a few older males mostly as in the past doing hobby things like contesting, dxing, rag chewing. Nothing wrong with that but there will not be a lot of new technology coming into ham radio that will allow it to do new things in new ways.

Rick, KV9U

I don't know, Rich. To me, it's a moot point. In Australia, using "Amateur Telephone" is illegal, and from what I understand, it was the government and not the hams who made that call. The LandLine Lids there literally operate illegally, but the Aussie govt has - so far - turned a blind eye on their activities and not enforced their regs.

I do know that at an international digital meet in Germany last April, there was organised "no wire" activity by some of the "movers and shakers" there. I can't speak for every individual Ham in Germany, but I can tell you that the folks who make things happen in that network are decidedly not interested in "Amateur Telephone".

So I couldn't say whether it's the govt in Germany or the Hams who outlawed "Amateur Telephone"... I'm just glad they did, so that your LandLine Lid buddies could not disrupt the Hams there who are trying to do something with radio.

> Do the equivalents of
>the FCC in those countries allow the amateurs to decide on policies at

Lots of people, not much real-estate, and it's been occupied since who knows when.. Travel 200 miles and hear a different language... Of course there are more regulations there! They're needed.

>In fact, I can't ever remember hearing one of them rejoice in the
>restrictions that are placed upon them. I'd be interested in hearing
>from any European ops who might have more information about the

>legal and economic issues that have affected them, in that regard.

When you hear from them, keep in mind that the conditions and "climate" there has lead up to the development of the most advanced, most useful packet radio net on the planet, at least ten years in advance of anything here in the states. In other words, what they have going there undeniably works. - Part of that "climate" is the fact that everything is done with radios. No LandLine Lids, no excuses, no cop-outs. Just Hams working with Radios.

I described an event, which was also noted and remembered by other BBS SYSOPs around the world who were operating at that time. Were YOU a BBS SYSOP at the time the "Internet Forwarders" first set up shop? Hmmmm ? I was.

>I contend that a lot of ops simply didn't see the need
>to spend more time and money on packet equipment, when the Internet
>became available, and was able to provide better service for their needs.

The @WW bulletin glut I described occurred before the Internet became generally available. You really have no clue as to what I am talking about, do you? Why do you bother to argue when you don't know what you are arguing about?

>Just about everyone has a limited amount of money to spend on their
>hobbies. Since most operators are users, not implementors, it makes
>a lot of sense for them to write their checks to AOL, and not HRO.

Well, Rich, there are Hams and then there are Hams.... What we are seeing with the exodus to the Internet is known as " separating the wheat from the chaff ".. It's my belief that Ham Radio in the USA will benefit from this enema.

Most of those who are bailing out are Internet geeks who found out that the claims of "Free access to the Internet with Ham Radio" were a scam. They were lied to, they were disappointed, so they split. I don't blame them. It was the jerks who lied to them who are at fault.

>

>and hardware happens to be.

None of those involve using the Internet as a cheap, ignorant way to avoid the use of radio. The applications you mention with APRS are like the ones I was talking up in the first place. No need to preach to the choir.

In other words, the APRS stuff is anything but "amateur telephone", and most certainly has nothing to do with "Internet Forwarding". Why should I object?

On Tue, 15 Sep 1998 13:46:24 -0500, "Charles Brabham"
<n5pvl@texoma.net> wrote:

: If the "transfer capacity and reliability" as you referred to it, had been
: enhanced normally through development of the Amateur Radio digital net, the
: @WW glut would never have occured, the US packet net would not have been
: overloaded far beyond it's ability to adapt, and we would have a situation
: in the US much closer to that in most of Europe instead of the current
: degeneration.

So you are frequently referring to Europe, so let me tell about the local situation here in Finland. In the late 80's and early 90's there were local packet activity here and there but bridging the local "islands" in a country with large distances was quite hard. While it is comparatively easy to build some infrastructure within a local club (such as repeaters), co-operative activities between clubs in different towns seem to be hard to arrange. Thus, the national Finnish amateur radio organization (SRAL) started to build a back bone network (based on 70 cm 9600 bit/s simplex technology), the radios and the TNCs are owned by SRAL, while the local clubs set up the equipment and provide the site, the power supply and the antennas. By this way, the packet network slowly reached the Central part of the country, although it is very thin at some points. The network is quite unreliable due to some technically overstretched links due to large distances between clubs and individual hams. Technically this network seems to be an dead end, since due to the long distances, higher speeds would require much more power and better paths to be reliable. It might be possible to upgrade 9600 bit/s full duplex, but in most cases this would need two sets of duplexers, since it would be hard to achieve required isolation with separate antennas.

In the local club (about 200 members) in recent years it has been very hard to get a SYSOP for the local BBS and the interest for packet radio has been quite low in general, most activity seems to be with the DX-cluster. After the reorganization of the club room last spring, the BBS has been inactive and no-one seems to be interested in reactivating it. The DX-cluster suffered some damage during a thunder storm in July and has been inoperable since then. Now that the HF-contesting season is approaching and the HF-contesting people are trying to find someone to rebuild the DX-cluster. While it has been legal here in Finland for more than a year to connect amateur repeaters and BBSs using the telephone network or the internet, this does not seem to have any effect in either in the positive or negative direction.

In Europe, the UK was the first country to liberalize the telecommunication sector soon followed by Finland. The prices has been reduced drastically and services improved very much during the last decade and within two years this liberalization is going to happen also in other EU countries. In many European countries, the amateur radio regulations have been changed into a more liberal direction, since amateurs are no longer concidered a real competitor to the public networks.

The internet penetration over here is one of the highest in the world (depending what you are measuring) with access points at work, in schools, at home and in public libraries. Half of the population have cellular phones and so on. In such circumstances it is quite hard to promote amateur radio and it is better to find something special that can not be done with other means of communication and not just trying to duplicate services that other have done better.

In my opinion, the land based point to point packet radio bulletin forwarding network is a dead horse and it is no use of beating it anymore. Packet radio can still provide interesting applications (even using 1200 bit/s AFSK simplex). The DX-cluster is a good example, with mainly broadcast style, low data volume with medium response time requirement. The APRS is an other interesting application. The BBS concept can even be used in ad hoc networks as the base station for voluntary search and rescue operations in the middle of the woods (with the whole station ready to run in a suitcase), in such aplications it is important to transfer small amounts of data in a reliable way. In general, the greatest benefit from using radio waves in the first place, is that you are not usually bound to a single fixed location. Any new ham applications that can exploit this, have a much greater chance of success.

Unfortunately, it is a little more complicated than that. When AEA went to the MBX firmware, the software grew larger than the original EPROMs. They went to a "daughter board" that plugs into the old EPROM sockets and hold the new EPROMs and RAM.

I sold my extra daughter board recently (from a defunct 232 -- I have 2) so can't help you directly. However, Timewave still supports the 232 and you can get the daughterboard and E-Proms from them. Look at www.timewave.com and select amateur products.

cheers.

I have a packet radio controller model PRC 6064A made by Hadron for the military.

Inside is two pc boards, one that says both Pac-Comm and TAPR. One eprom says State 1.09, and another eprom has a date of May 1988 and a version number of 1.1.5.

The other board is a Hadron FEC board.

Is this a TNC-2 compatible contoller? Does anyone know where I can get the manual? What is a good terminal program to use with this TNC? Is this compatible with ham TNCs?

doing.

Because I'm not interested in doing so. I have served in "officer" positions in a variety of organizations, including several ham clubs. I can do that sort of thing, but don't enjoy it. I'd rather let others run the day to day stuff, and direct my efforts as I see fit. I get a lot more done that way.

I enjoyed editing TPRS's Q-Report, but would not want to work with TPRS or TAPR, now that I have discovered that niether organization is really dedicated to supporting or advancing Amateur Packet Radio.

So forget about me being a "mover and shaker" in your little world... Thanks but no thanks.

I have, contrary to your claim, not commented about how bad "the rest of us" are doing. I have specifically talked about how bad YOU are doing, and about the damage YOU have done to Amateur Radio with your mindless campaign to first take the RADIO out of Ham Radio with "Amateur Telephone", then take the DECENCY out of Ham Radio with the "Anything goes on the high bands" deal you have been pushing lately.

Your sick insistence of trying to force tcpip upon the Ham Radio digital net no matter what the consequences has lead you to promote "Amateur Telephone" in the full knowlege that it would damage the integrity of the Amateur Radio digital net.
Now you are promoting "anything goes on the high bands" in full knowlege that the introduction of filth, spam, and advertising into the Amateur Radio digital net will irreversibly damage of the few things we hams can still hold our heads up about - The fact that Ham Radio is one of the few places where one can find simple DECENCY.

I look at you, Greg, and I can be completely certain that I have scraped much better off of my shoe.

Why would I be interested in participating in the petty intrigues, back-biting, and working at cross-purposes that goes on, wherever you have been put in charge of anything? Thanks, but no thanks.

I'm a Ham, and proud of it. Take your telephone and shove it.

Me.

It is no big deal to handle the traffic via ham radio.

I don't accept messages which have traversed the Land Lines
when ham radio means are available.

Take a look at QST: their most recent "digital radio" columns
have failed to even mention the word "radio" but instead have
become "Ain't the internet wonderful!" columns.

> Name a few Charles.

Yes, you are right of course Greg, the Land Line Lids have
pretty well destroyed the Ham Radio networks. Some of us are
working to restore those networks. Sorry I can't say more on
this topic, but my HF system needs more work ... so I'll get
back to actually moving the traffic via Ham Radio instead of
playing around here on the internet.

How come this discussion is not being held on the Ham Radio network?

This is indeed the case in the few places that Charles might be able to point
to.
Although I doubt Charles can actually back up his statement made in the initial
posting.

Having had dealings with a number of PT&T in Europe and else where in the late
80's with regards to modem standards and interfaces for the large computer
company I worked for at the time, the PT&T kept a close hand on things. Much
like what they do here in the US with third party traffic rules. Like we can
send messages to Cuba, but not other places might have made more sense 10 years
ago.

>packet net. The reasons that this has occurred is certainly open
>to debate. You are asserting that a correlation is also a de facto

>Just about everyone has a limited amount of money to spend on their
>hobbies. Since most operators are users, not implementors, it makes
>a lot of sense for them to write their checks to AOL, and not HRO.

I agree with you here Rich. Many of Charles statements are simple logic by
analogy then proven on any fact of actually causation.

The people who turned to alternate means to long distance communications were
trying to solve the problem they had at the time. That of a amarteur radio
packet network that was losing the necessary crticial mass to continue to grow
and users still sending more and more messages. As critical mass dropped so
did support of nodes in areas that were thin to begin with. Networks broke

down. Traffic backed up. Local users complained and sysops tried to find something to do about it.

As to Charle's dreaded gateways. People put up gateways like amateurs in earlies ages experimented with SSB and now experiment with Spread Spectrum. They tried something new. There is no causation between the IP gateways starting up and the continued down trend in networking, since the down trend had started well before the IP gateways that Charle's points to existed. Also, something that Charles forgets, there were wormholes being used in amateur packet radio documented in "Gateway" as early as 1982 or 83. Before even Charles knew what AX.25 packet radio was.

Here in Texas, as Charles pointed out, the state is so large it is impossible in some place to keep a network maintined. Many of us always felt we could easily build the network, but the local support was never there to keep it maintained, unless you wanted to drive 10 hours to fix something when it was down. Even in the hey day of packet radio could it have been maintained. It is much easier in a small countries with higher population density to maintain good amateur radio networks.

Charles is good out pointing out how bad things are, but as I have pointed out in past postings he only talks about things and never really wants to participate in actually networking with the group that does want to do things. I guess it is much more fun to sit back and point fingers then to actually implement things locally, statewide, or nationally. How about a second node to your network Charles and then a third and so on? I think the point is that you have pretty much pissed everyone off in the North Texas area that might have considered working with you in expaning your FlexNet node into a network.

>who had a tremendous concern for protecting their power base.
>
>And the cost was too high they told me for the average ham to get involved
>in our area at least for "high speed" 9k6 packet much less 56K.

Well. It was never really an issue of price. It was more an issue of technical expertise. I was doing 9K6 in 1987 for a cost of like $100. An RCA-700 and TPRS modem. The issue was I went over to someone's house and got mentored on how to modify it and get it operational. It was always an art to learn what types of radios to get and which could be modified and then how to interface to the modem and then have something to talk to.

It wasn't plug and play. As I have written about in one of my TAPR President's column (http://www.tapr.org) we did it to ourselves to a certain extent. TAPR after the TNC-2 success was never able to pull off the packetRadio project, which was to provide a 9600/1200 2-meter radio for a cost under $500. Just one of those things. Past history for TAPR. The commercial field was happy in selling lots of 1200b TNC-2 with no additional development cost for a number of years. By the time the commercial folks tried to introduce faster speeds we were already past a critical point. That critical point being that the first generation of technical experimenters had already moved onto something else which left a hole in the development and implementation of systems that would grow in size.

You'll have to forgive me if I have simplified the statement above for the sake of keeping the posting short. But that was one of many issues involved and possibly one of the main ones.

>As I predicted many years ago, if we did not act quickly to access the
>internet and use its strong points with ham radios complementary strong
>points, we would be preempted by the internet.

>And we are now pre-empted by the internet. We are having this discussion not
>on ham radio.....but on the internet.

I discuss this on ham radio all the time. Just no on packet radio.

>I really see ham radio slowly becoming more and more irrelevant to potential
>new entrants and it will be mostly vhf family communications like our family
>does, or just a few older males mostly as in the past doing hobby things
>like contesting, dxing, rag chewing. Nothing wrong with that but there will
>not be a lot of new technology coming into ham radio that will allow it to
>do new things in new ways.

This is were I do disagree a little. I see the hobby going through a paradigm shift and a refocus on what it does as a hobby. It is not bad if we get smaller as some think. If anything, we will see amateur radio shift back from the last era of consumer operators to a more balanced number of technicians and experimenters in the mix with those that just want to communicate.

If we can't accomplish getting back to our roots of experimentation and trying new things, then we will see amateur radio become less in many ways. Smaller number of bands, fewer numbers, etc.

>> Who besides yourself ?
>
>Me.
>
>It is no big deal to handle the traffic via ham radio.
>
>I don't accept messages which have traversed the Land Lines
>when ham radio means are available.

Okay. You and Charles. I don't believe anyone else in Texas does it -- do they Charles ?

But how do you know when a message is handled over a non-RF channel ? I guess you are killing all traffic from Texas then ? Oklahoma ? Parts of Ark ? Since a majority of BBSs still use TexNet to send traffic across the network and while we no longer have the ClayDesta connections we only have a wireline between Dallas and Austin which provides a major connection across the network.

My point has always been, "Not the abandonment of wireless communications, but the use of circuits for regional networking for high-speed communications where you can't build radio connections or maintain them."

Charles likes to twist that meaning around, but my statement says let's communicate. It is up to the group or individual to determine their needs on how they accomplish this communications.

Yes, we could communicate to El Paso from Dallas via HF (and David Cheek did it for years), but then again sending simple e-mail messages with more than 80% of the message is a header is not what people want to be playing with and having fun. Many want to be experimenting with video, multimedia servers and the like in mobile environments and still be talking to a friend in another state or at some far off distant place. Then we have people who want to improve communications on HF. Maybe we can support faster speeds on HF and one day have a national network via HF. Maybe we can put digital systems on the future SkyStation or the equiv when they are placed at 21km floating above metro areas. At least I had a meeting year before last on that subject with a company that might be interested in letting amateurs have a ride on their system. Get a few of these up and we could easily create a crossed link all radio based digital network to cover the entire US. Maybe one day we will have some geo-sync satellites up that we can use to accomplish this task. Maybe there is a possibility of getting free access to a channel on a commercial geosync satellite that we can use with our own uplink capability. Would that be considered telephone ? I bet Charles would say yes. Although it is all radio.

The issue is that we have to move forward with communications technology. After the technical and experimentation phase is passed you have to have something that allows people to communicate or their is no growth. We are dealing with a small sub-set of amateur operators and thus it requires a larger coverage to get enough critical mass going to make it fun and continue its growth. This will mean that we have to depend on things other than all radio networks in situations that allow people to get involved that wouldn't be if we limited them to just radio communications for the long distance links in certain situations. How can you say it should be 'illegal' for someone to tie radio systems together by some alternate means other than "radios" to allow them to have fun and hopefully learning something along the way...and with luck provide some emergency communications?

What gets me is how we can't agree that this is all amateur radio. I still use radios in my communications. I still talk to someone else with a radio at the other end. Does it matter that the information we are transferring travels via HF or some other means ?

To me no. To you and Charles, the answer seems to be yes.

The concept I am looking forward to is high-speed local loop communications. The ability to see a weather spotters video of what they are seeing, the ability to send live radar images out to the spotters, the ability to hold video conferencing for local officer meetings instead of having to meet in person, and there are lot more things I am sure amateur radio operators will experiment with. Turn this into multi-channel digital voice repeaters that can be supporting a phone patch, several voice channels, someone transferring a file, someone listening to the ARRL news, and a lot more. I am doing it right now under the STA and it is a lot of fun to begin to build new high-speed spread spectrum networks that have the speed to deliver interesting applications.

A company in Calf has a less than $1500 repeater and handheld units that cost less than $500 that implement 802.11 which would allow all this to happen now, if people could operate it without having to do it under an STA.

Once we can get people communicating at 250Kbps or faster speeds on 900Mhz or 2.4G they will figure out how to communicate between each other. Just like with the original TNC-1 at 1200. Add to this a 3Mbps radio project on 440 and 219 for linking between nodes and doing local and small regional networks, we start to see some interesting possibilities for the future of amateur packet radio. You might not agree with this approach, but there are a lot of folks who do.

We could go ultra fast on HF if we wanted to. The issue is cost. I have been told that there are systems on HF that easily do 28.8Kbps or faster, but the cost is prohibitive.

>Take a look at QST: their most recent "digital radio" columns
>have failed to even mention the word "radio" but instead have
>become "Ain't the internet wonderful!" columns.

Well, have you written Stan ? Have you sent him a message ? Probably not, lets just complain instead of trying to help build consensus or discuss things

logically. If you think Stan should be writing about something, you have to let him know. Could be his editor wants him writing that way. Hard to say until you ask. Do you read any of Don's articles in CQ/VHF ? He had a very good article on RF modems, based on the book Tom McDermott, N5EG wrote for TAPR.

>this topic, but my HF system needs more work ... so I'll get
>back to actually moving the traffic via Ham Radio instead of
>playing around here on the internet.

That was not my statement. You might have meant Charles possibly ? I don't know of any Lids in amateur radio currently. The definition I always thought was a Lid was someone who used bad operating practices. I doubt anyone doing technical stuff uses poor operating practices. It is very petty that you and Charles want to label people for pursing something they see as fun. Amateur radio is made up of a lot of different individuals who like to do different things. If we start by trying to label people by what they do, then we lose the whole purpose of what I think amateur radio is good for -- that of bringing people of diverse backgrounds together in a unique and special hobby.

I have always felt that the stance you and others have taken of shouting to the roofs about the negative things you think people are doing have done more harm then any one person or group has done with respect to experimenting or playing with their radios. People want to be involved in things that are positive, have a vision, and are going places so they can participate. Why would anyone want to participate in your vision when it is based on a negative statement that what everyone else is doing has caused the death of amateur packet radio. I know I sure wouldn't want to. I would either find some other aspect of the hobby or probably not even get into amateur radio.

>How come this discussion is not being held on the Ham Radio network?

Easy answer. You wouldn't be reading this if I was posting on packet radio. I gave up trying to defend myself on packet radio debates long ago, since most of the time my message would somehow disappear (sysop killed maybe along the way) before reaching were it might go. I still read messages, but haven't posted in a long, long time.

Greg, WD5IVD

In article <6tpksnaaf1@nnrp1.dejanews.com> , w0rli@my-dejanews.com writes:
>Sorry, you don't WANT proof. When it was offered (excerpts from
>BBS log files published on the Ham Radio network) you ignored
>the evidence. Oh well, no big deal: you don't seem to be ON the
>Ham Radio network Greg. Have not seen a message from you for nearly
>a year now ... only here on the internet.
>

When and where were they published ? Oh packet radio....
I guess it never made it to my local PBBS. Maybe it showed up while I was on vacation and never saw it then either. Why do you expect I would have read it if it was on packet radio ? Just because I am on here and I don't post or tell people my PBBS address, doesn't mean I am not on packet radio.

Maybe you can post it again or send me a copy of it so I can read it now.

I know I collected messages from sysops a few years ago to do an analysis on header issues. That was a look at the amount of overhead was generated by header information as compared to message content.

I would love to see those logs and discuss your experimental method used in the analysis of the data. Never hurts to have someone else member check your data to help with credibility of the published results.

>Because I'm not interested in doing so. I have served in "officer" positions
>in a variety of organizations, including several ham clubs. I can do that
>sort of thing, but don't enjoy it. I'd rather let others run the day to day
>stuff, and direct my efforts as I see fit. I get a lot more done that way.

Okay then. Find someone else in your area that believes in what you do and
then get them pumped about doing it. That shouldn't be to hard ? Okay, you
don't want to led....you sure about that...you have the statements for it I
think.

>I enjoyed editing TPRS's Q-Report, but would not want to work with TPRS or
>TAPR, now that I have discovered that niether organization is really
>dedicated to supporting or advancing Amateur Packet Radio.

Well, if TAPR isn't dedicated to supporting and advancing Amateur Packet Radio
then I don't know who else does in the US. Sorry that you don't see this or
feel this. Lucky for us the increasing membership in TAPR doesn't agree with
you on this issue.

>So forget about me being a "mover and shaker" in your little world... Thanks
>but no thanks.

Never asked you to be Charles. I simply suggested that you go out and try to
make something happen. As I once was told by the author of the AX.25 code in
the TNC-2, those who code or build hardware rule. I am only suggesting that if
you want to see the future the way you talk and write about will mean you have
to actually do something about it yourself. No one else will probably show up
and do things the exact way you want it to be done. You might have a little
input, but in the end the designer or write of the system has the ultimate say.
You can write all you want, but in the end writing will have little or no
impact on the actual future of the thing.

>I have, contrary to your claim, not commented about how bad "the rest of us"
>are doing. I have specifically talked about how bad YOU are doing, and about
>the damage YOU have done to Amateur Radio with your mindless campaign to
>first take the RADIO out of Ham Radio with "Amateur Telephone", then take
>the DECENCY out of Ham Radio with the "Anything goes on the high bands" deal
>you have been pushing lately.

Well, lucky for me it is only you humble opinion. You are not on my list of
people who I ask their input regarding my work.

As to issue of access across gateways. I think you missed my point. My point
was you have to somehow limit in one hand, but not limit on the other. You
stated that you would have to control all access from both sides. You
determine what is available. You have no need to control what is allowed from
the amateur side other than who has access. Amateurs have to take

responsibility for the information they access. We already have rules in place to take care of those instances were rules are violated. Just as with inappropriate language or jammers and any other manner of breaking the rules. As a gateway owner/operator if you don't feel comfortable with who you give access to, then you need to close their access down. As to the issue of someone from the Internet getting access, that is easy enough solved with existing methods and procedures. Again, it is a matter of defining what is appropriate usage of a resource. Just like is done with many resources used in amateur radio.

If you call this approach "Anything goes on the high bands" I would disagree. I call it giving people responsibility for their action. I believe we should always take as much overhead out of administration as possible. There is no need for big-brother or big-govt over the amateur radio side of things. If an amateur operator abuses their responsibility then you can do something about it.

Now you say you don't comment on how bad others are. I think many others in this discussion would comment differently, since you have insulted and said negative things about many of them in your posts. Let's try to keep this a discussion, although based on past postings I know that will be impossible. We seem to have entered into the name calling period of the message thread....haven't we Charles ?

>Your sick insistence of trying to force tcpip upon the Ham Radio digital net
>no matter what the consequences has lead you to promote "Amateur Telephone"
>in the full knowlege that it would damage the integrity of the Amateur Radio
>digital net.
>Now you are promoting "anything goes on the high bands" in full knowlege
>that the introduction of filth, spam, and advertising into the Amateur Radio
>digital net will irreversibly damage of the few things we hams can still
>hold our heads up about - The fact that Ham Radio is one of the few places
>where one can find simple DECENCY.

Hum -- sick? I don't think so. Practical. Why would anyone want to use TCP/IP over ham radio? It is a simple scale of economies fact that every computer anyone gets today has a TCP/IP stack built into the OS ? If we don't take advantage to existing technology in the ham shack, then we are shooting our self in the foot. We have to take advantage of the fact that Microsoft or Apple has spent millions to implement TCP/IP as a simple communications interface on every computer someone purchases.

We thus build radios that are Ethernet TCP/IP in and RF out. Amazing -- that is just what the TAPR 900Mhz SS (Spread Spectrum) radio project is (http://www.tapr.org/ss). The modern equiv of the serial port for $25 (Ethernet) talking to a radio that talks to another radio using a mode that allows multiple users on the channel without interfering with one another. How the amateur community decides to use this radio or links of radio is their care. Their free will. I only care that we can get amauteur operators using radios that go 250Kbps (at least). Get a new model of networking going and get fresh concepts and blood into the area so that we can start to do more tecnical stuff with a larger critical mass involved. Give them a tool and let them build with it. Much like what the VADGC TNC, TAPR TNC-1, and TAPR TNC-2

accomplished.

I don't see your proof that TCP/IP on the amateur bands is going to "damage the integrity of the Amateur Radio digital net." Do you __mean__ Internet gateways here instead of a communications protocol. Be specific now. If you think Internet gateways are bad, then what type ? Gateways that provide point-to-point/point-to-multipoint or ones that allow access to the Internet.

"anything goes on the high bands" -- see above for answer to this repeat issue.

>I look at you, Greg, and I can be completely certain that I have scraped
>much better off of my shoe.

Hum -- another insult. Oh well. We always get back to this don't we Charles. When all else fails attack the person not the subject matter. Par for the course Charles.

>Why would I be interested in participating in the petty intrigues,
>back-biting, and working at cross-purposes that goes on, wherever you have
>been put in charge of anything? Thanks, but no thanks.

Doesn't even deserve a reply comment. See last response.

>I'm a Ham, and proud of it. Take your telephone and shove it.

I am Ham and proud of it as well. I am even prouder that I mentor others in the hobby and dedicate my time as a volunteer as TAPR's president.

Cheers - Greg, WD5IVD

Join TAPR, join a club designing the future of amateur packet radio. Join a club that Charles, N5PVL, thinks is destroying amateur digital communications and prove him wrong. :=)

3865. Guide to the rec.radio Newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-17 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6tqclh$ldj@news.Hawaii.Edu>
Source record: 22405
Cross-posted to: rec.radio.amateur.dx,rec.radio.amateur.digital.misc

Archive-name: radio/personal-intro

This message describes the rec.radio.amateur.*, rec.radio.cb, rec.radio.info, and rec.radio.swap newsgroups, as well as their Internet mailing list counterparts and complements. It is intended to serve as a guide for the new reader on what to find where. Questions and comments may be directed to Jeffrey Herman, KH2PZ, (jeffreyh@hawaii.edu), or Paul Schleck, K3FU, pschleck@novia.net.

This message was last changed on 14 March, 1998.

History
=======

Way back when, before there was a Usenet, the Internet hosted a mailing list for hams, called (appropriately enough) INFO-HAMS. Ham radio discussions were held on the mailing list, and sent to the mailboxes of those who had signed up for it. When the Usenet software was created, and net news as we now know it was developed, a newsgroup was created for hams: net.ham-radio. The mailing list and the newsgroup were gatewayed together, eventually.

Over the years, as the net grew, the volume of discussion became progressively higher. First one by one, and then as part of two reorganizations, what was once one group became many. In the process, developments elsewhere on the net were reflected in the groups as they were created, most notably the change to place all of the ham radio groups in one hierarchy.

The collection of newsgroups continues to grow as more people join the net, and as more topics of discussion gain volume, I expect to see more groups be created as well. This follows what is happening on the rest of the net.

Nearly all of the radio newsgroups have corresponding mailing lists, the notable exception being rec.radio.swap. There are also a few mailing lists that don't have newsgroups.

The Current Groups
==================

It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette.

The rec.radio.amateur.misc group is the catchall. It is what rec.ham-radio was renamed to during the first major reorganization. Any message that's not more appropriate in one of the other groups belongs here, from contesting to DX to ragchewing on VHF to information on becoming a ham.

The group rec.radio.amateur.digital.misc is for discussions related to (surprise!) digital amateur radio. This doesn't have to be the common two-meter AX.25 variety of packet radio, either; some of the most knowledgeable folks in radio digital communications can be found here, and anything in the general area is welcome. The name was changed to emphasize this, and to encourage discussion not only of other text-based digital modes, such as AMTOR, RTTY, and Clover, but things like digital voice and video as well. The former group, rec.radio.amateur.packet, was removed on September 21st, 1993. It is obsolete, and you should use .digital.misc instead (or the appropriate new mailing list, mentioned below). The group has .misc as part of the name to allow further specialization if the users wish it, such as .digital.tcp-ip.

The swap group is rec.radio.swap. This recognizes a fact that became evident shortly after the original group was formed: Hams don't just swap ham radio gear, and other folks besides hams swap ham equipment. If you have radio equipment, or test gear, or computer stuff that hams would be interested in, here's the place. Equipment wanted postings belong here too. Discussions about the equipment generally don't; if you wish to discuss a particular posting with the buyer, email is a much better way to do it, and the other groups, especially .equipment and .homebrew, are the place for public discussions. There is now a regular posting with information on how to go about buying and selling items in rec.radio.swap; please refer to it before you post there. To answer a frequently asked question: No, there is no mailing list that goes along with this group. If you can't read Usenet news directly, you're out of luck.

The group rec.radio.amateur.policy was created as a place for all the discussions that seem to drag on interminably about the many rules, regulations, legalities, and policies that surround amateur radio, both existing and proposed. Recent changes to the Amateur Radio Rules (FCC Part 97) have finally laid to rest the Great Usenet Pizza Autopatch Debate - it's now legal to order a pizza on the autopatch, if you're not in the pizza business - as well as complaints about now-preempted local scanner laws hostile to amateurs, but plenty of discussion about what a bunch of rotten no-goodniks the local frequency coordinating body is, as well as the neverending no-code debate, may still be found here.

The group rec.radio.cb is the place for all discussion about the Citizens' Band radio service. Such discussions have been very inflammatory in rec.ham-radio in the past; please do not cross-post to both rec.radio.cb and rec.radio.amateur.* unless the topic is genuinely of interest to both hams and CBers - and very few topics are.

The rec.radio.info group is just what its name implies: it's the place where informational messages from across rec.radio.* may be found, regardless of where else they're posted. As of this writing, information posted to the group includes Cary Oler's daily solar progagation bulletins, ARRL

bulletins, the Frequently Asked Questions files for the various groups, and radio modification instructions. This group is moderated, so you cannot post to it directly; if you try, even if your message is crossposted to one of the other groups, your message will be mailed to the moderator, who is currently David Dodell, WB7TPY. The email address for submissions to the group is rec-radio-info@stat.com. Inquires and other administrivia should be directed to rec-radio-info-request@stat.com. For more information about rec.radio.info, consult the introduction and posting guidelines that are regularly posted to that newsgroup.

The groups r.r.amateur.antenna, .boatanchors, .dx, .equipment, .homebrew, and .space are for more specialized areas of ham radio: discussions about antennas, the older tube based amateur, military, and commercial gear, commercially-made equipment, homebrewing, and amateur radio space operations. The .equipment group is not the place for buying or selling equipment; that's what rec.radio.swap is for. Similarly, the .space group is specifically about amateur radio in space, such as the OSCAR program and SAREX, the Shuttle Amateur Radio EXperiment; other groups cover other aspects of satellites and space. Homebrewing isn't about making your own alcoholic beverages at home (that's rec.crafts.brewing), but rather construction of radio and electronic equipment by the amateur experimenter. The .dx group is devoted to long distance amateur communications. Each of these subgroups has its own charter and FAQ; please refer to the archives to find these documents.

Except for rec.radio.swap and rec.radio.cb, all of these newsgroups are available by Internet electronic mail in digest format; send a mail message containing "help" on a line by itself to listserv@ucsd.edu for instructions on how to use the mail server.

All of the groups can be posted to by electronic mail, though, by using a gateway at the University of Texas at Austin. To post a message this way, change the name of the group you wish to post to by replacing all of the '.'s with '-'s - for example, rec.radio.swap becomes rec-radio-swap - and send to that name@cs.utexas.edu (rec-radio-swap@cs.utexas.edu, for example). You may crosspost by including multiple addresses as Cc: entries (but see below). This gateway's continued availability is at the pleasure of the admins at UT-Austin, and is subject to going away at any time - and especially if forgeries and other net.abuses become a problem. You have been warned.

Mailing Lists

In addition to the mailing lists that mirror the Usenet newsgroups, there also are a few that stand alone. These cover specific areas of ham radio, and discussion is focused on just those areas.

The cq-contest mailing list is for discussions of contesting in ham radio. To join, send email with the word "subscribe" on a line by itself to cq-contest-request@tgv.com.

The DX mailing list covers the finer points of DXing. This one is also joined by mailing "subscribe" on a line by itself, this time to

dx-request@unbc.edu.

There's also a VHF mailing list, for VHF operators of the weak signal persuasion. You can join this one be sending "subscribe vhf" on a line by itself to vhf-request@w6yx.stanford.edu.

The QRP-L list is devoted to building and operating gear at low-power outputs. To subscribe, send an email to listproc@lehigh.edu and only write: subscribe qrp-l Your Name.

The TopBand e-list is devoted to all areas of operation on 160m. To subscribe, send an email to majordomo@contesting.com and only write: subscribe topband and follow the instructions you'll be sent.
This site, contesting.com, also hosts a couple dozen other ham-related e-lists. Use the above address, and only write: lists to get the entire index.

The Boatanchors e-list is devoted to the older tube-based ham, military, and commercial communications gear. To subscribe, send an email to: listserv@listserv.tempe.gov and only write: subscribe boatanchors

For homebuilding transmitters and receivers using tube technology, there is the Glowbugs e-list; send an email to: majordomo@piobaire.mines.uidaho.edu and only write: subscribe glowbugs <your@address.here>

The VHF DX discussion list can be accessed by sending an email to: majordomo@blacksheep.org and only writing: subscribe VHF-DX-discuss.

Qth.net hosts over 100 ham-related e-lists, including lists devoted to each state, manufacturer, mode, band - too many to state here. Send an email to majordomo@qth.net and only write: lists to get the complete index.

For one of the most complete indexes of email lists, see http://pw2.netcom.com/~ac6v/pageae.html

Please do NOT send subscription requests to the mailing lists themselves; that doesn't work very often, and is very annoying to those on the list. Also, please keep your electronic mail address current with any mailing lists you subscribe to, as dealing with returned email is a nuisance for the person maintaining the mailing list.

A Few Words on Crossposting
==========

Please do not crosspost messages to two or more groups unless there is genuine interest in both groups in the topic being discussed, and when you do, please include a header line of the form "Followup-To: group.name" in your article's headers (before the first blank line). This will cause followups to your article to go to the group listed in the Followup-To: line. If you wish to have replies to go to you by email, rather than be posted, use the word "poster" instead of the name of a group. Such a line appears in the headers of this article.

One of the few examples of productive cross-posting is with the rec.radio.info newsgroup. To provide a filtered presentation of information articles, while still maintaining visibility in their home newsgroups, the moderator strongly encourages cross-posting. All information articles should be submitted to the rec.radio.info moderator so that he may simultaneously cross-post your information to the appropriate newsgroups. Most newsreaders will only present the article once, and network bandwidth is conserved since only one article is propagated. If you make regular informational postings, and have made arrangements with the moderator to post directly to the group, please cross-post as appropriate.

Nope. I might do allright as a consultant or a troubleshooter, but would make a poor adminstrator. I've tried it a few times. I always get bored when things start looking up, and move on. I could probably do the Ham community the most good as a synthesist, but nobody in the Ham community is set up to take advantage of that.

If you examine the few suggestions I have made, you'll discover that they are all simple, inexpensive and generally low-tech. All "do-able" right now, and all of them will yield results which will far outweigh the effort and expense involved in implementing them. They also all involve Radio.
My response to the challenge of Amateur Radio is to discover unconventional, effective solutions using Radio, when the conventional methods produce poor results. The simple, elegant solutions I have suggested are published in the public domain, available to anyone. If I spent all of my time promoting or "selling" them, or indulging in "leadership", I would not have much time for coming up with more simple, elegant solutions, would I? It certainly would be stupid to distract myself from what I do best, by tying up all of my time doing something I'm not suited to.

>

>
>Well, if TAPR isn't dedicated to supporting and advancing Amateur Packet
Radio
>then I don't know who else does in the US.

I've always been impressed with the crew at NEDA, who are presently crippled by a bogus hopelessness but who nonetheless are still one of the best group of networkers in the USA. Burt's disgust at the lack of volunteered money

and "strong backs" is just a symptom of fatigue. When he gets rested up a bit, I believe he will find out that there are other, better ways of obtaining money and "strong backs" which work just fine, and do not require "supermen" in order to fly. If you or Burt want clarification on this, ask by private E-mail. I won't discuss this further, here.

The most healthy packet organization I know of in the USA at this time is SEDAN. As far as I can tell, nobody there has been talked into doubting themselves or Amateur Radio.

>Sorry that you don't see this or
>feel this. Lucky for us the increasing membership in TAPR doesn't agree with

He was correct, but only within a very narrow context. Too narrow to use as a general rule of thumb, for sure. Pull your head out and look around, and you'll discover that there's a great big world out there.

You seem to have a tendency to go for "jingoism", Greg. Is that why amateur tcpip enthusiasts always parrot the same little "catch phrases" as a substitute for independent thought? Hmmmm? You are worse than many of them about mouthing jingos without having a clear, personal picture of what you are talking about.
" Any scientist who cannot explain what he is doing to a six-year old child is a charlatan."

> I am only suggesting that if
>you want to see the future the way you talk and write about will mean you have
>to actually do something about it yourself. No one else will probably show up
>and do things the exact way you want it to be done.

I'm not that big on insisting that things be done exactly to my specifications. My objections to stupid, irresponsible practices are just that, and not an attempt to win some sort of "political" battle.

>You might have a little
>input, but in the end the designer or write of the system has the ultimate

say.

The "system" I work with is a global network designed, built, and maintained by thousands of individuals, all doing things in their own, unique way. There is no "designer" to have an ultimate say. The people you talk about might have a little input, but an anarchic, diverse group of highly individualistic Hams have the final collective "say", and they say it a new way every hour of every day, a thousand times over.

If you are uncomfortable with this and can't dance to that tune, you will always find yourself trapped and limited by your "design" like a bug in amber. Like now.

> You can write all you want, but in the end writing will have little or no
>impact on the actual future of the thing.

You don't even believe that yourself.

>
>>I have, contrary to your claim, not commented about how bad "the rest of us"
>>are doing. I have specifically talked about how bad YOU are doing, and about
>>the damage YOU have done to Amateur Radio with your mindless campaign to

>was you have to somehow limit in one hand, but not limit on the other. You
>stated that you would have to control all access from both sides. You
>determine what is available.

Not unless it violates PART97. No obscene stuff, no advertisements, nothing that will generate personal profit.

You are really stupid to suggest this. I, for one, will be glad to assist any outraged parent who's child has a Ham ticket and sees pornography on the packet net in tracking you, the person who promoted such a lowering of our standards of decency, down so he can discuss the matter privately with you. If I feel my input will aid in coming to an understanding more rapidly, I'll be glad to make my humble contribution to that discussion.

Your arguement that "the rules are there to enforced" is pretty cynical when you are, in the same breath, suggesting that the rules be thrown out of the window.

My suggestion is that you pull your head out of the cesspool of academia for a few moments and familiarize yourself with reality. You know; The real world. The world where most Hams are decent people who do not share your conviction that everything must be sacrificed in the name of expediency - YOUR expediency.

>You have no need to control what is allowed from
>the amateur side other than who has access. Amateurs have to take
>responsibility for the information they access. We already have rules in
place
>to take care of those instances were rules are violated. Just as with
>inappropriate language or jammers and any other manner of breaking the
rules.

Oh, yes, we all are so impressed with how vigorously these rules are being enforced.

You're batting 1000, Greg; One moronic suggestion after another, all of which are completely out of touch with reality.

>As a gateway owner/operator if you don't feel comfortable with who you give
>access to, then you need to close their access down.

Yes, I know your methodology: Place an additional burden upon "Joe Ham", who you are already used to blaming for everything.

> As to the issue of
>someone from the Internet getting access, that is easy enough solved with
>existing methods and procedures. Again, it is a matter of defining what is
>appropriate usage of a resource. Just like is done with many resources
used in

How many of them run alleged "Packet Radio Organizations", Hmmm?

>Let's try to keep this a
>discussion, although based on past postings I know that will be impossible.
We
>seem to have entered into the name calling period of the message
>thread....haven't we Charles ?

It's worse than that. You skipped the name-calling, and simply promoted actions and ideas which you knew would disrupt and undercut the Amateur Radio digital network. You declared war on Amateur Radio a long time ago, Greg, and ever since you have consistently attempted to talk Hams out of believing in what they can do with Radio, and to develop a dependence upon commercial communications carriers instead. Now you are attacking the very DECENCY of Amateur Radio, knowing that DECENCY is one of the very pillars of the fraternity of Hams.

Your amateur tcpip buddies use the Internet to "route around" and undercut Amateur Radio at every opportunity. This includes HF, VHF, UHF, Packet, CLOVER, PACTOR, AMSAT, and any other way that hams have found to communicate digitally via Amateur Radio. Whewrever Hams try to build up a RADIO network, there is always a "landLine Lid" there with his tcpip software, eager to "hack" Ham Radio.
Except where it's illegal. You know; Those places where the Ham digital net has GROWN and ADVANCED over the last decade, while we have been destroying ourselves with "Amateur Telephone", while you promoted and defended the practice?

I call them as I see them. I think of you as a worthless jerk. As I heard commented at Ham-Comm a few years back,
" Greg Jones couldn't be more obvious if he had the word JERK stencilled across his forehead. "

>
>>Your sick insistence of trying to force tcpip upon the Ham Radio digital
net
>>no matter what the consequences has lead you to promote "Amateur
Telephone"
>>in the full knowlege that it would damage the integrity of the Amateur
Radio
>>digital net.
>>Now you are promoting "anything goes on the high bands" in full knowlege
>>that the introduction of filth, spam, and advertising into the Amateur
Radio

>>digital net will irreversibly damage of the few things we hams can still
>>hold our heads up about - The fact that Ham Radio is one of the few places
>>where one can find simple DECENCY.
>
>Hum -- sick? I don't think so.

You don't think, period. You claim you once did in 1982, but I have seen no evidence to support that allegation.

>Practical. Why would anyone want to use TCP/IP
>over ham radio?

I dunno... The software sucks, and apparently it is only useful for Amateur Radio in small, ingrown, isolated LANS. According to all the "experts", tcpip just is not worth doing on HF, or on any of the existing long-haul Ham Radio network. That pretty well puts it out of the running for serious use by Hams.

Amateur tcpip has been around a long time, and has resulted in - nothing. There IS NO global Ham Radio tcpip net. It's a sucker bet, Greg. It's a way to "talk" but not "walk", a way to simulate an actual Ham Radio digital net without building one.

>It is a simple scale of economies fact that every computer
>anyone gets today has a TCP/IP stack built into the OS ?

A simple fact of economics is that free software which performs much better than tcpip is available to Hams everywhere.

>If we don't take
>advantage to existing technology in the ham shack, then we are shooting our
>self in the foot.

A good reason for TPRS to scrap every one of their TexNet nodes, and immediately replace them with FlexNet. The PC, the 1.2 and 9.6 modems, and software cost around 200 bucks per node. Cheaper if they already have an old PC. Even cheaper if you build your own modems. ** Be sure your 9.6kb modem is capable of full-duplex operation. ** You'll be wanting that, later on.

>We have to take advantage of the fact that Microsoft or
>Apple has spent millions to implement TCP/IP as a simple communications
>interface on every computer someone purchases.

No, actually we don't. We, as Hams, are fortunate in that we have developed software of our own which does the job much better FOR OUR PURPOSES. - Software which gives us a first-rate Amateur Radio network, as opposed to a third-rate imitation of the Internet. It's all free, and FOR OUR PURPOSES AS HAMS, it performs much, much better.

>
>We thus build radios that are Ethernet TCP/IP in and RF out. Amazing --
that
>is just what the TAPR 900Mhz SS (Spread Spectrum) radio project is
>(http://www.tapr.org/ss). The modern equiv of the serial port for $25

>(Ethernet) talking to a radio that talks to another radio using a mode that
>allows multiple users on the channel without interfering with one another.
How
>the amateur community decides to use this radio or links of radio is their
>care. Their free will. I only care that we can get amauteur operators
using
>radios that go 250Kbps (at least). Get a new model of networking going and
get
>fresh concepts and blood into the area so that we can start to do more
tecnical
>stuff with a larger critical mass involved. Give them a tool and let them
>build with it. Much like what the VADGC TNC, TAPR TNC-1, and TAPR TNC-2
>accomplished.

Go for it. Talk to the telcos if you need advice... They're already doing
it, and have been for a couple of years now.

>
>I don't see your proof that TCP/IP on the amateur bands is going to "damage
the
>integrity of the Amateur Radio digital net." Do you __mean__ Internet
gateways
>here instead of a communications protocol. Be specific now.

Specifically, tcpip's performance sucks but I don't see anything wrong with
Hams who try to make it work with radios. That's a matter of personal taste,
IMHO.

Gateways are misused, and abused. Your "doers" have been so busy pursuing
the destructive, "hacker" aspect of them that they have made little if any
progress in utilizing them in a positive fashion.

Only the APRS folks have made a serious effort and produced actual results.

>If you think
>Internet gateways are bad, then what type ? Gateways that provide
>point-to-point/point-to-multipoint or ones that allow access to the
Internet.

I only object to misuse of gateways to undercut and replace the use of
radios by Hams. I have been suggesting responsible uses of gateways for
years, but LandLine Lids are not interested in being responsible.

They hear from you too much, I suppose.

Source record: 22409

When logic and respect for the opponent fails, it ceases to be a discussion.

1) Ham Radio is a hobby
2) Ham Radio Operators are in it for the fun, or learning experience.
3) Mode popularity is just that. Popular modes change frequently.
4) Old modes never return to popularity.

A lost cause is a lost cause, no matter how much sugar you put on it.

Whether Internet Radio Servers are feasible or not, the mode is dead
as far as any future is concerned.

The next popular data mode hasn't been designed yet, and we are
all bored until it is designed, or busy in the shack playing with
what we think may be popular. It's not a political correctness
thing. We do it because we are having fun.

Rather than piss about your favorite mode being unpopular (CW,
AX.25) just have fun, and forget about what your neighbor is
doing. He's probably using another obsolete mode, so you're
both going nowhere just as fast.

Steve

It appears to me, Steve, that despite all logic, you have lost respect for
Amateur Packet Radio and so should probably stay out of any discussion of
that subject.

>
>1) Ham Radio is a hobby
>2) Ham Radio Operators are in it for the fun, or learning experience.
>3) Mode popularity is just that. Popular modes change frequently.
>4) Old modes never return to popularity.

Number 4 is wrong. The rest are incomplete, but fairly accurate as far as
they go.

>
>A lost cause is a lost cause, no matter how much sugar you put on it.
>
>Whether Internet Radio Servers are feasible or not, the mode is dead
>as far as any future is concerned.

Sour grapes. "Any" covers a lot of ground. A bit too much for me to lose
sleep over your assessment.

>
>The next popular data mode hasn't been designed yet, and we are
>all bored until it is designed, or busy in the shack playing with
>what we think may be popular. It's not a political correctness
>thing. We do it because we are having fun.

As long as your "fun" does not intrude on others or go beyond the pale in
some way or another, there's no problem. Everybody gets along.

When your "fun" undermines the efforts of thousands of your fellow Hams,
though, it's time to find something new to do, before your "fun" bounces
back on you.

Maxim did not hesitate to deal sternly with "Lids" in his day. In modern
times though, it is no longer politically correct to point out Lid-Like
behavior, which goes far in explaining why Amateur Radio has become full of
contention, controversy, and weak sisters who want to legislate all of those
terribly restricting RULES and REGULATIONS out of existence altogether.
If they had any grace, they would move on to Citizen's Band Radio, which is

already set up according to their ideal, instead of trying to make Amateur Radio over in CB's image.

That's why I have become indifferent about "political correctness". If a few Lids have get their widdle feelings hurt in order to get the hobby back on track, I don't have any problem with that at all.

>
>Rather than piss about your favorite mode being unpopular (CW,
>AX.25) just have fun, and forget about what your neighbor is
>doing. He's probably using another obsolete mode, so you're
>both going nowhere just as fast.

I suppose Steve's next suggestion will be a sort of Ham Radio "Jonestown", where we all commit mass suicide from the boredom and pointlessness of it all.

You first, Steve!

Seriously though, Steves mention of "piss" reminds me...

Let's say one night I was hanging out near the town well, and here comes my neighbor, drunk. He staggers over to the well. The alcohol has affected his judgement, and the well looks awfully handy to him, because he really needs to whizz. It's the expedient thing for him to do. My neighbor, unaware of my presence, unzipps his fly...

To be politically correct, I would have to stand frozen as I considered my neighbor's feelings. How could I possibly embarass him, or intrude upon his solitude? If I interrupted him, would he turn and drunkenly let loose in my direction? What if he became belligerent, and I ended up having to scuffle with him? Scuffle in my new designer jeans? In the cosmic scheme of things, doesn't he have the "right" to do as he wants?

While all that soul-searching is going on, the question would soon be moot, because my neighbor would soon finish up and stagger on.

I don't go for the politically correct approach, though... I figure that my neighbor is actually better off to suffer the embarassment of having his error pointed out, rather than stand by and watch him compound it.
You could say that in doing so, I was really doing the best job of sparing his feelings in the long run, but that's not the main reason I would try to stop him, embarassed or not...

Hey, I drink out of that well, too!

I have a question before buying a TNC. I was told that I should be looking for a TNC that supports nodes, such as KA.

My question is, first of all, do I have to have NET/ROM or KA to connect to nodes, or is that only if I want to be one myself?

Another question -- I am looking at getting a used KPC3 or maybe even a new KPC3+. Should I plan to spend more money later to get the firmware that supports KA or NET/ROM, or do they mostly come with that stuff already?

Thanks

No, you both have different perspectives. Steve doesn't see forwarding as destructive, because he saw the network fail for different reasons in his own area. You, however, saw it fail in your own area because of internet forwarding. While many subjects can have the perspective baggage torn off, this isn't one of them. For example, the BBS system in my area tends to move email relatively reliably, as long as the mail is to a BBS user in state. It also doesn't choke on bulletins. It even moves mail in state relatively effeciently. Go outside those bounds, no one gets jack, but we still get all the bulletins. From my perspective, internet forwarders haven't hurt anything. My mail gets moved in my theater of operations and it doesn't when it leaves my state. As a matter of fact, I could care less if a internet forwarder were to setup shop outside of my state, as long as it guaranteed that my message would get a bit closer to its destination. If internet forwarders were actually moving so much useless traffic, they would also be taking along all sorts of *useful* mail for the ride through the worm hole. I doubt seriously any of those guys deliberately block mail and forward bulletins. If they do, they should be shut down for other reasons, not for their transfer technology. If their software does, then the software needs fixing.

As to a solution to the problem, perhaps the network could be differentiated into two parts, mail-only and bulletin only, with the backbone for each disallowing any traffic from bulletin network from imposing on the mail network, and the mail network capable of taking over bulletin bandwidth when needed. Mail only could be constrained to mail. If someone wants to reach several people at once, they create an email list. Most of the messages sent world wide are useless for 90% of the users who rarely login to their local BBSs anyway, because they aren't reading most of it anyway, and yet they continue to be hams. Why not junk bulletins? When I contact a ham on the internet, besides in this forum, I have to know their address. Why should it be any different for radio? Leave forsales, etc., on the internet, where there is tons of bandwidth to waste. BBS listservers could be setup and mail bounced to *only* those BBS user addresses on the list instead of every BBS nationwide. After trying to reply and get a response from several bulletins on BBS, its pretty clear no one pays them

any mind and the senders typically don't even respond.

Another solution comes to mind over the BBS bulletin issue. First, setup a bulletin *header only* transfer system, that only transfers during times where no mail is pending. Rewrite all software to support it. This would guarantee that bulletins only filled the lull, right down to the packet. Then a person logs into the BBS to see if they see an interesting bulletin. If they do, they send a message to a bulletin server maintaining that particular topic, and it shoots the message back. Sure, the person will have to wait, but why should everyone take mail delays for bulletins only a few read?

David

forwarding.

Not really. The network in my immmediate vicinity never did lose any ground,
and in fact gained a couple of new nodes a month or so back.

My perspective in this issue (Internet Forwarding) is global. I have
talked with many SYSOPs around the world while looking into this matter, and
have been in contact with amateur Radio organizations almost everywhere, not
just a few local US clubs.

I seriously doubt that Steve has made any particular effort to look into the
matter at all. - He just wants to shoot his mouth off.

>While many subjects can have the perspective baggage torn off, this isn't
one of

You have just described the very sort of damage Internet Forwarders
typically do.

>My mail gets moved in my
>theater of operations and it doesn't when it leaves my state.

Exactly. The HF forwarders are no longer there, and the LandLine Lid who
undercut them has since quit or moved on to other things, leaving you with

no interstate or international forwarding capability to speak of.

No new HF forwarder is likely to go through the trouble and expense of setting up in your area now, because he knows that after all of that effort, any jerk with tcpip software and a telephone modem can set up shop and undercut his traffic is no time flat, dirt cheap.

That's why we will be shutting down our Internet Forwarders here in the USA.

>As a matter of
>fact, I could care less if a internet forwarder were to setup shop outside of my
>state, as long as it guaranteed that my message would get a bit closer to its
>destination.

Yes, that's exactly the Non-Ham attitude which has destroyed the US packet net. If you had seen the lack of throughput as a good reason to advance and expand your local net's HF forwarding capability and gone on from that point, you would be acting like a Ham, instead of acting like a Lid.

>If internet forwarders were actually moving so much useless
>traffic, they would also be taking along all sorts of *useful* mail for the ride
>through the worm hole. I doubt seriously any of those guys deliberately block
>mail and forward bulletins.

They deliberately block my mail. That implies to me that they deliberately block other's mail as well.

>If they do, they should be shut down for other
>reasons, not for their transfer technology. If their software does, then the
>software needs fixing.

Naw, there's no need to get excited. Stations which censor private messages get cut out of the loop pretty fast. - And even if they are not cut out, they are most certainly routed around. The anarchic "structure" of the packet net guarantees this, with no particular effort on anyone's part.

>
>As to a solution to the problem, perhaps the network could be differentiated
>into two parts, mail-only and bulletin only, with the backbone for each
>disallowing any traffic from bulletin network from imposing on the mail network,
>and the mail network capable of taking over bulletin bandwidth when needed. Mail

>once, they create an email list. Most of the messages sent world wide are
>useless for 90% of the users who rarely login to their local BBSs anyway,

>because they aren't reading most of it anyway, and yet they continue to be hams.

That's a good idea, but I doubt that it will actually go into use. Lots of those around. (Good ideas)

>Why not junk bulletins? When I contact a ham on the internet, besides in this
>forum, I have to know their address. Why should it be any different for radio?
>Leave forsales, etc., on the internet, where there is tons of bandwidth to
>waste.

The thousands of Hams with no Internet access might have an objection to that. Remember that in your world, "everybody" wants and has Internet access, but that does not reflect the way things are everywhere and with everyone. It's easy to slip into provincialism that way.

>BBS listservers could be setup and mail bounced to *only* those BBS user
>addresses on the list instead of every BBS nationwide. After trying to reply and
>get a response from several bulletins on BBS, its pretty clear no one pays them
>any mind and the senders typically don't even respond.

Sounds like a local problem.

>
>Another solution comes to mind over the BBS bulletin issue. First, setup a

>send a message to a bulletin server maintaining that particular topic, and it
>shoots the message back. Sure, the person will have to wait, but why should
>everyone take mail delays for bulletins only a few read?

Packet BBS's have been doing something similar, but more sophisticated for a little over five years now.
Works like this:

Every time the BBS recieves a new bulletin or a new one is entered there, the BBS shoots off an unproto broadcast of that message's header and title.

Client software at the Users' QTH recieves these bulletin headers and builds them into a list. There is no need to connect to the BBS to look at headers, unless your station has been off the air and has missed them. In this case, the client system requests and recieves a bulletin header update upon it's

next connect to the BBS.

"Joe Ham" comes home from work, sits down at his station, and reads through the bulleten header list already on his system. He points and clicks at the ones he wants to see.

Then "Joe Ham's" station automatically connects to the BBS, and downloads the selected bulletins, using the same compression method that BBS's use when forwarding to each other. (30-60% compression.)

Hi! and thanks for read my message
I have a Pac Comm 220 TNC but I have problems to work now.
When I run the tnc, during the initialization, on the left of screen appears several "C" characters on a column (I dont know what is this)and when the initialization finish I can receive packets but the tnc do no transmit.
I don have the manual of tnc. Can you help me what can I do?
Thanks a lot for your answer

3885. Timewave's new area code is not enabled everywhere!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-19 00:00:00 UTC
From: rgawtry@timewave.com
Message-ID: <36033f73.0@news2.minn.net>
Source record: 22425
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.misc

The response to Timewave's new PK-232/DSP upgrade kit for the PK-232 has been outstanding, but some people have had difficulty reaching Timewave by telephone because of the new area code (651) assigned to the St. Paul, MN area. Some telephone switching centers (including some major telephone companies, cell phone companies, and some private companies with call restriction by number) are not programmed to accept the 651 area code. You may even be told the 651 area code doesn't exist! If you have this problem when you dial 651-222-4858 to get Timewave, just use the old St. Paul area code - 612-222-4858.

Upon some investigation of this problem, we found that it is a common problem around the country as new area codes have proliferated. One parent couldn't call his son at college for two months! If you have the problem, talk to your phone company service department or to your company telephone system administrator. Some companies are very uncooperative and others fix the problem within a few hours.

Well, first, off, I suppose I'll have to say that Steve, if you really
believe there is no such thing as destructive, inconsiderate behaviour, you
need to seek professional help as soon as possible. You may very well be a
danger to yourself and others. I have done volunteer social work for many
years with drug addicts, battered women, gang members, runaways, alcoholics,
and so on. I know what I'm talking about, old boy. The tip for the day is:
Get help voluntarily while you can.

My end of this discussion involves protecting an element of Amateur Radio
known as "Radio". Hardly a fringe element.
My personal assessment is that "Hams" who insist upon using the telephone
and pretending that it is "Amateur Radio" constitutes the real "fringe
element" in the hobby. - The lunatic fringe.

The Amateur TCPIP community is alone in insisting upon using the telephone
in preference to radios, and is alone in insisting that Amateur Radio's
basic standard of decency be not just lowered, but dropped altogether.

Yep, Steve, you are definately part of the "fringe element" of Amateur Radio
as a LandLine Lid. - The lunatic fringe. If you don't like that, maybe you
should start acting like a Ham Radio operator for a change.

>in the first place.

I'm afraid you have "BBS technology" on the brain. Get over it, Steve.
You're fighting a one-sided battle on that issue, against yourself. Having a good old time?
I am objecting to "Amateur RADIO technology" being bypassed by those who are so incompetent that they literally have to communicate with each other by telephone and *pretend* that they are participating in Amateur Radio.

This undercuts the BBS network, for sure, but only so much as the BBS net uses Amateur Radio to communicate. The sad fact though, is that the "keyboarders", the AMSAT folks, the DX Cluster users, the APRS enthusiasts, VHF/UHF digital networkers, and, in effect, all Hams who try to use Radio to communicate are affected just as much by "LandLine Lids", when their RF networking is undercut and displaced by "Amateur Telephone".
Additionally, every single Ham is affected when LandLine Lids directly endanger our bit of spectrum by insisting that we quit using it to communicate, demonstrating a preference for using Non-Ham means of communication instead. - And to no particular point.

>
>Just because 6 people get together to pass bulletins on HF,
>is no proof of a society.

So I take it that in "Steve's Reality", there were never more than six HF forwarders, kind of like the is no such thing as "inconsiderate and destructive behaviour".

Glad I don't have to live there.

>
>Why do you call me a moron? I've never met you, and I don't

I've called you a moron because you have not displayed much intelligence. Most of your opinions on this subject can be more accurately be described as delusion. - The kind that adversely affects others. You earned it, old pardner.

You have insulted my intelligence, your own alleged intelligence, and that of every Ham Radio operator on the planet. That's not known as "respect" among rational folks.

Pathetic wretch. Get a life.

This could serve as a description of the situation here in the states as
well. Except where population density, high site availability, and geography
allow us to establish robust networks (such as our GRAPES network), most
of the infrastructure is very sparse, very fragile, and very slow. That's not likely
to change either because it is dictated by geography, demographics, and
economics. A robust national network is simply not in the cards for the US.
It may be possible in central Europe, where population density and geography
permit, but not here where the ham population clusters are often widely
separated.

>In the local club (about 200 members) in recent years it has been very

Traditional BBS networks, whether radio or phone line based, are a passe
concept. People want direct switched packet connectivity today. They
have that with the internet, and they expect that in amateur radio networks
as well. We can offer that over limited areas with packet radio, but national
networks aren't going to happen due to the geography, demographics, and
economics I mentioned above (and due to ham politics, which is a very
important factor not yet mentioned, but for which Charles could serve as
poster boy).

>In my opinion, the land based point to point packet radio bulletin

>in the first place, is that you are not usually bound to a single
>fixed location. Any new ham applications that can exploit this, have a
>much greater chance of success.

That's a good analysis. Exploiting the mobility and broadcast nature
of radio networks is a direction I think we should pursue. In that respect,
we are kicking around a novel application here in the Atlanta area. Our state
DOT has a large number of unattended traffic radar sites monitoring
average vehicle speeds on our major roads. This information is available
in near realtime over the internet from their website. But that's only of
passing interest to those in fixed locations. To someone commuting to
work, however, that information would be valuable for alternative route
selection if it were available in the vehicle.

We're attempting to design an application which will grab those speed
reports and transfer them to 1200 baud packet as node number and speed
number pairs. This will allow anyone in a car with a simple packet setup to
have the speed information available to them in near realtime. The information
volume is low enough for this to work over a low speed network. And the
information is inherently broadcast, so we don't need to use a connected
mode protocol. (The major design hurdle is in the way the information is

selected and presented in the car. Users need to be able to filter the information for only the routes which interest them, and the information needs to be presented in a way that isn't too distracting to someone driving in traffic.)

The few of us with mobile 56 kb packet can already access the DOT site via the internet gateway on our network, and even download the pictures from the various traffic cameras located around the area. But that's a high data volume application, and most amateurs don't have mobile 56 kb setups, so we're trying to do the radar speed data application for those with lesser packet capabilities.

What we're attempting isn't demanding of new hardware or new network topologies. It is simply a new application for our existing packet switched networks. Networks are ultimately application driven, and the popularity of networks is directly proportional to the attractiveness of the applications available for them. IMHO the main reason the bulletin forwarding BBS applications are declining is that they no longer offer us anything attractive. These newsgroups, webpages, and direct email have supplanted their role for fixed station users, whether their access is wireline or high speed packet radio. We need to be developing applications which can exploit the unique characteristics of a radio based packet switched network instead of beating the dead horse of bulletin forwarding BBS applications. Their time has passed, we need to move on.

If you have the RS-232 connection set up properly (correct port, etc.),
you can communicate with the 1278 using most any terminal or modem
program. I use the TERMINAL.EXE program that comes with Windows 3.1.

If the 1278 doesn't immediately send a sign-on message to the terminal
program, you may have to send it several carriage returns (so the 1278's
AUTOBAUD circuit can figure out the baud rate). Then all the 1278
commands should work. Try typing MODE, and it should respond with
PACTOR or whatever it's currently set up for.

After that, you'll probably need the manual, because there are many
available commands and options.

Charles didn't see the network fail because of internet or even wireline
forwarding. Instead he saw the number of people using the system drop,
and the number of people willing to put up with delays drop too. What
he wanted built not only was not financially feasible if it were to compete
or outperform the internet, but it also required dedication to doing something
solely so that it was all RF using amateur radio. Packet radio in effect
is 20 years old. It came, it attracted users and now most of the users have
moved on to either using it differently (APRS & DX spotting) or not at all.
The telling point is that Charles feels the need to get on the internet and
say that it caused the failure of packet radio, when it truth, it didn't fail,
it just metamorphasized into something else for most of the remaining
users.

Source record: 22434

I've been asked to figure out a way to enter a call into a BPQ or NetRom's NODES list manually. - Hard-coded, so to speak.

I have no SYSOP access to a NetRom node, so I fired up a copy of BPQ to give it a shot. The best I could figure out how to do was to manually add the call to BPQ's ROUTES list. - No bueno!

Can anybody give me a hand with this?

Charles Brabham, N5PVL

You can add to both the ROUTES and NODES lists. Typically one would
add manually only to the ROUTES list and non-neighbor nodes would be
picked up from the broadcasts of neighbors. From the bpq documentation:

BPQNODES.COM

This program dump the ROUTES and NODES tables to a file (BPQNODES). This
file is then used to initialise the above tables when the switch is
reloaded. It should be run before reloading the switch, and if possible
at regular intervals, so that if the system crashes, it comes back with
a reasonably up-to-date view of the network. Many BBS systems allow you
to run a program as part of the forwarding cycle, or at specified times.

It is possible to edit the BPQNODES file. This provides a way of defining
Route Qualities, etc. without changing BPQCFG.TXT, or using SYSOPH.

The file format is: ({} indicates optional entries - don't include the{})

ROUTE ADD CALL P QUAL {!} {VIA DIGI1 {DIGI2}}

where P is the port, QUAL the Quality, and the optional ! indicates a
locked route. Up to 2 DIGIS may be specified.

NODE ADD ALIAS:CALL CALL-1 P QUAL {!} {CALL-2 P QUAL {!} } {CALL-3 ....}

where CALL-1, CALL-2, CALL-3 are up to 3 alternate routs, which must be
defined (by ROUTES config entries or ROUTE ADD) before being used.

Although locked nodes are allowed, I strongly recommend that they are used
only in exceptional circumstances (eg when using a digi'ed route). Note
also that a locked route to a node will be removed if the system finds 3
higher quality routes to it.

I don't know about Netrom, since it has been orphaned for several years
and documentation is no longer available. It is likely the same as for
Thenet:

LOCKING NODES - Occasionally a need may arise to modify node entries in the NODES table. The SYSOP command for this is:

N [LOCKED NODECALLSIGN] + ALIAS QUALITY OBS PORT [LOCKED NODECALLSIGN]

For example: N K7WAA-1 + CAHTO 0 0 0 K7WAA-1

Assuming the path to neighbor node CAHTO is unreliable, good network management practices would dictate CAHTO be locked out. In the above example, setting the QUALITY to 0 will prevent CAHTO from appearing as a direct path. Setting the Obsolescence count to 0 makes CAHTO be listed as a permanent locked entry. If the Obs count was set to a value between 6 - 1, this locked entry would then be deleted at a time as established between Parameters 4 (Obsolescence counter) and 6 (Broadcast interval).

To manually unlock CAHTO, the command is reversed:

N K7WAA-1 - CAHTO 0 0 0 K7WAA-1

Here one will note, the minus sign is used for this purpose. It is essential the unlock command be the same as the lock command, with the exception of the minus sign.

Setting the Obsolescence to zero permanently locks the destination node into the nodes table. Even if the locked node fails, it will still be listed in the nodes table. For this reason, the locked NODES procedure is not often used as it's counterproductive network practice to broadcast failed nodes. It should be noted this procedure only works with "Net" nodes capable of generating valid Level 4 Transport Layer responses. If one attempts to connect from the node to a locked TNC or a KA-node, one will initially see a connect made. But when TheNet fails to receive a return Level 4 acknowledgement after two or three interrogations, the circuit is disconnected.

The LOCKED NODES command to use if a node should NOT have an alias is:

N [LOCKED NODECALLSIGN] + * QUALITY OBS PORT [LOCKED NODECALLSIGN]

Usage example: N AK7Z-1 + * 143 0 0 AK7Z-1

LOCKING ROUTES -- There may be times a NodeOp will want to modify the path
quality value of a route to a given node. If for network management reasons
one wants to isolate one network from another as far as preventing the flow
of NODES broadcasts from intermingling, the locked routes technique is
preferable over the locked nodes procedure. If one wants the existence of the
isolated node to be known, then a combination of nodes and routes locking
could be used. The locked routes command is:

R PORT [LOCKED NODECALLSIGN] + PATHQUALITY

To unlock the routes use:

R PORT [LOCKED NODECALLSIGN] - PATHQUALITY

The process of locking routes or nodes as explained here is called "perming." Perming is normally done when it is necessary to IMPROVE network throughput. The most common example of perming is when reliable neighbor nodes have their PATH QUALITY values set HIGHER than the value listed in Parameter 2. The ROUTES locking command is used for this situation. If the NODES locking command were to be used, then the neighbor would remain in the NODES tables and therefore be broadcast into the network even if that neighbor should fail.

HTH,

Bob

The fact that people may not use the terminology doesn't imply that people
don't want the results. People who have used packet radio for long
periods of time like me for example don't think that 1200 baud even with
rf forwarding is such a big deal. Better than nothing, but it is slow, and it
is not always reliable either. You know it, and I note that you don't get
as wide and varied a response to your postings on packet as you do
on usenet? Most of the hams posting on here have at least one TNC
and one radio capable of doing packet, now why do we use the internet
instead?

Hmm sounds to me like a comms problem, the 220 is an old beast, and
its probably set to a 7bit word, try setting it to 8bit I can't
remember the code, I think its something like
AWlen 8 PAR 0 or something like that!

My daughter called our fone company, US West, to get voice mail.
We live in area code 651, but was told that there was no 651 when she
was asked for her fone number. She explained to the sales person that
this will be our new area code in Jan 99.

We have been told to practice using it now, in order to get used
to it.
FYI- The twin cities got divided up. Minneapolis is 612 and St.
Paul is 651. We can still dial each others city with out area code
until Jan.

> nodes, or is that only if I want to be one myself?

No, you do NOT have to be running a Net/Rom node in order to be able to
connect to one.
You only "need" the Net/Rom firmware IF: You intend to leave your TNC
and Radio on 100% of the time, and if it is "beneficial" to the overall
network in your local area.

> Another question -- I am looking at getting a used KPC3 or maybe even a new
> KPC3+. Should I plan to spend more money later to get the firmware that
> supports KA or NET/ROM, or do they mostly come with that stuff already?

The KA firmware is built into every KAntronic's TNC.... hence the KA.
Net/Rom will not run in a Kantronics TNC, because the Kantronics TNC's
are not TNC-2 "Clones", and use a different processor. The recently
released K-Net firmware chip for several of the "later" model Kantronics
TNC's however does a rather nice job of behaving like a Net/Rom node.

Another LandLine Lid rushes to the defence of Internet Forwarding, despite the fact that the practice is indefensible. Lacking a logical or accurate arguement, Art has no other "weapon" at his disposal except for misdirection and lies.
I suppose that Art belives that if he repeats the same hackneyed old LandLine Lid "catch phrases" a few more times, they will be believed by people dispite all of the factual evidence to the contrary. Early students of propaganda called Art's methodology "the big lie", and not without cause.

Repeat your lie often enough, the theory goes, and eventually it will be accepted as "truth" by the more gullible portion of the general population. Art, like many LandLine Lids, leans heavily on this primitive, 1920's style of propaganda because that's how he was subverted in the first place.

I saw the network crippled, folks, due to the actions of LandLine Lids. Many other BBS SYSOPs and networkers saw and remember exactly the same thing. None of these people, of course, had been suckered by the "big lie" as Art has, so of course from his viewpoint, they should be ignored at all costs. W0RLI has offered documentation on several occasions, but got the response one can only expect from people who are deluded and have a big investment in staying that way.

Pitiful Wretches.

Hey Art, you better stick your head a little deeper into your bucket of BS. That'll keep you from hearing those inconvenient, embarassing FACTS.

Shove it in, OM. Shove it in deep.

Enjoy!

It looks like Art believes that if he runs down the Ham digital network,
then that somehow makes it "OK" to engage in destructive, stupid behaviour.

No Art, sorry but talking negatively is not a good justification for acting
in an even more negative fashion.
Your lies do not excuse your actions, and your actions most certainly do not
justify your lies.

Pathetic Lid.

Charles, I can count the times you've contributed to a technical
discussion on my big toe. You have never been a leader, you offer
no direction, but merely chant a dogmatic theme that was obsolete
at least ten years ago.

Not too long ago, despite what you read in ARRL articles, we had a
disaster here, in which 168 people were killed and another 300 dumped
onto the street. All we had was repeaters and packet radio BBS.
Ham radio failed in that disaster. FEMA listened to our capability,
and told us to work with the Salvation Army and Red Cross. What
that meant, was that we had zero value for the immediate problem.
Cellular Phones did not work (the cell was saturated), and the
volume of traffic was too great for Ham radio (digital or voice).

Now, what kind of leadership in this discussion do we have?
We have a dogmatic BBS front, composed of one guy who
sends 4 word messages to large paragraphs of discussion,
and the Hitler youth himself, Charles. Who says being a
leader would take too much time. Fuck you then, move over,
and get out of the way. The old saying is: lead, follow, or
get out of the way. Since you two can't do the first two, and
have told us you can't, then the only option is that of a
bystander. Your vote doesn't count. You have to lead an
opposition, you can't just use the logic of "because."

Now, what did FEMA need? The needed a command post
that filtered raw data, into requirements. The raw data
was taking too much time in transit. How do they increase
the traffic so they can apply logistics. As any soldier knows,
bad raw data leads to bad decisions in the command post.
FEMA solved their problem by bringing in a satcomm
system that laid down conventional phones everywhere
in the disaster zone. Each was able to get out of the
zone. It was the only way to avoid saturation of the
poor wireless solutions.

Ham radio, to be viable as an emergency communications
system, needs to get its shit together. No longer is
it acceptable to be mediocre. What Charles and his
idiot buddy in Portland (3rd and Burnside probably) offer
us is a bystanders expression. A burp or a fart, in no
way helping the ARS.

How can Ham radio be more than a For Sale BBS?
How can Ham radio serve the country?
How can Ham radio live up to its duty, its past

honor, its vision?

When I went to survival school in the Air Force, we
spent a couple of days in a POW camp. What Charles
is doing is called "Resistance." What that is, is it
is a method of the preventing the Commandant
from getting the information he needs. The way
you do that, is to always change the subject. If
the interrogator wants to talk technically, you talk
non-technically. That way, you make a lot of noise
and wear the interrogator down. Charles is trying
to wear us down, although even he himself probably
doesn't realize that. Most clinical idiots don't know
what they are doing on a conscious level, but the
effect is well known and used in prisons.

We need to push them aside, and focus on the
end game. The end game is communications
logistics. We need a system of getting raw data
to a command post. This command post may be
40 miles away, it may be a continent away.

Steve

Charles, it's about time you started responding to what I write, rather than posting personal attacks. I defy you to find another ham who can truthfully state that I acted as a lid on the air or even off the air towards that ham. If you can't deal with facts, I strongly suggest you increase your medication!

Hams have deserted packet radio bbs operation, both former sysops and users. It wasn't just the internet which made packet radio go away, but packet itself is 20 years old, and it's changed in those 20 years. In 1984 for example, most people hadn't yet been on packet, even if they were interested. Now most of the people interested have been, and it doesn't meet their needs. Between flame sessions, hams cutting off forwarding from certain routes or certain hams, slow throughput, and the like, amateur radio packet is lucky that dx spotting and APRS exist, or there would be even fewer folks out there willing to play with things. I also note that the TCP/IP community you attack is apparently the group most likely to be running 9k6 modems or faster. I first tried 9k6 in 1992, sadly the only way I could find someone to connect to at that speed was to connect to myself. E-mail sent via the internet is more reliable than packet mail, even you have to admit it. Fewer people would ever even have the opportunity to read your ramblings. The internet didn't destroy packet radio, packet radio destroyed itself basically. In 1991, when HF forwarding was in full swing, I would hate to have been dependent on the packet network during an emergency though. Most of the HF gateways weren't on emergency power or the folks supposed to feed into the gateways weren't. Yes there are networks of all radio that work, but networks like the Sedan network in the Southeast also couldn't handle bulletins either. The infrastructure just isn't there, and hams probably aren't willing to spend the money necessary to create your dream. One more time, demonstrate a regional network that works, is reliable and cheap, and other hams will follow. We have more repeaters than we need presently too, but most repeaters also only cover local areas. A network which requires hundreds of hams to

cooperate requires a common goal, and your attacks on other hams is a REAL INCENTIVE to reach your goal isn't it? Where's your network Charles? Where's the info on setting up a cheap reliable system that you can prove exists now? Lead or forget complaining about how you think things should be.

From what I understand, FlexNet handles IP transparently, just as it does
other protocols.

That may have something to do with FlexNet's motto being "We route
everything."

As poorly-qualified as I am to help you reflect and reexamine your views on Charles Brabham, I hope you will bear with me while I begin this sincere and earnest attempt. And please don't get mad with me if, in doing so, I must comment on a phenomenon that has and will continue to fight with spiritual weapons that are as savage as they are lame-brained. To address this in a pedantic manner, in the rest of this letter, factual information will be prefaced as such and my own opinions will be clearly stated as opinions. For instance, it is a fact that unscrupulous fanatics are receptive to Brabham's fickle messages and fool easily. Brabham, please spare us the angst of living in a fallen world. We don't have to stand for this!

It can be distinguished only with difficulty which of his vassals act out of inner stupidity or incompetence and which only pretend to for whatever oppressive, mad reason. Certainly, there's no point in arguing with him. Brabham's treatment of favoritism mirrors the attitude that many prurient authoritarians hold towards nativism. Yet Brabham can pervert any established ideology. He claims to have turned over a new leaf shortly after getting caught trying to combine, in a rare mixture, bestial cruelty and an inconceivable gift for lying. This claim is an outright lie that is still being circulated by his disciples. The truth is that this is the precondition for my crusade against debauched antidisestablishmentarianism.

It's time for him to grow up. There's a little-known truth that isn't readily acknowledged by crass virulent-types: His anal-retentive foul-mouthed sentiments are to politics what the blitzkrieg was to international diplomacy. Don't kid yourself: Brabham's cohorts remain a small isolated minority, except during times of economic or social stress, when a mass following develops to blame morally-questionable sick paper-pushers for the problems besetting society. To summarize my views: Charles Brabham's maladroit catch-phrases run counter to human nature and, as such, are doomed to failure.

I just want to say one thing: Charles Brabham confuses demagoguery with leadership and undocumented conspiracism with serious research. Although not without overlap and simplification, I plan to identify three primary positions on Brabham's excuses. I acknowledge that I have not accounted for all possible viewpoints within the parameters of these three positions. Nevertheless, Brabham's disciples produce precisely the alienation and conflict needed to rip off everyone and his brother for dubious reasons or for no reason at all. He always tries to shift blame from himself to patronizing nit-picky practitioners of nonrepresentationalism. It's likely that one of these days he will spawn delusions of absolutism's resplendence if we don't stop him now. Unfortunately, there is no shortage of individuals and organizations, many of whom may seem innocent at first glance, who secretly want to increase society's cycle of hostility and violence. Essentially, sententious menaces thrive on hatred rather than love.

Creating needed understanding is best achieved in a calm, rational environment. If someone were to engage in an endless round of finger pointing, I'd rather it be an army of deplorable porn stars than Brabham, because the latter is shabby, while the former are only uppity. All in all, the only effective and responsible course of action is to step back and consider the problem of his quips in the larger picture of popular culture imagery -- an often frustrating prescription, to be sure. He should try being a little more open-minded. Let me explain. He will adopt or abandon any principle to obtain power. To say anything else would be a lie. While I can't speak for anyone else, I believe that the perverted authoritarianism in Brabham's diatribes is not always explicit.

In the past, people like Brabham would have been tarred and feathered for trying to galvanize an anal-retentive hysteria, a large-scale version of the odious mentality that can manipulate public understanding of Dadaism. As I mentioned before, for some strange reason, he is worried he'll be disenfranchised and shunned by the most stupid exhibitionists I've ever seen. His views can be rightly understood only as what some anti-democratic peddlers of snake-oil remedies have been brave enough to call them: a failure. What I mean to say is that his doctrines just don't stand up. There are other strains of jujuism active today, and the siren calls of those movements may mesmerize pusillanimous election-year also-rans whose misguided behavior blinds them to historical lessons. Just don't expect consistency from a man who is thoroughly and indeed disrespectful. In conclusion, let me just say that Charles Brabham's proxies are grumpy at best, the downfall of society at worst.

(Message just posted to packet)

I am posting a response to the recent message posted by Charles N5PVL
to the packet network accusing me and TAPR of something that is NOT true.
What Charles posted is a lie. His message is attached below.

Charles has the gall to take a thread posted to USENET out of context
and then post his spin on it to the packet network, where most of you
reading this doni¿½t care or haven't been reading the exchanges to date.

Charles states that I am on a campaign to change Part 97 rules
regarding pornography. I am NOT currently involved in any such
activity and will not be in the future. Nor is TAPR involved in
such activity.

The issue that Charles has chosen to post this foul and spiteful
message about what he would led you to believe I am doing is in
regards to a message I posted on USENET. I stated a few days ago
that I believe that Part 97 is enough to define what is and isnï¿½t
against the rules. Charles wishes additional rules on digital
communications that define what isnï¿½t and is allowed. I believe
that Part 97 covers this currently. Why should digital
communications be treated further as a second class citizen and
suffer additional rules regarding content that other modes would
not also have to follow.

It is up to amateur radio operators to interpret the current rules
and limit operation of amateurs that our somehow breaking those
rules. It doesnï¿½t matter if they are communicating via digital
means or some other form of amateur communications. It is all
amateur radio. NO additional rules are required in order to make
this happen. If an amateur is breaking the rules, it is simple
enough for the network admin to simply cut off access to the
resource (i.e. network or gateway in the thread being discussed)
where the infraction is taking place.

As to the issue of non-hams gaining access to amateur radio
resources. There are several easily implemented means to keep
non-hams off amateur freqs that might happen via an Internet
gateway.

What Charles wishes to do is strip the rights that amateur operators
have to experiment and play with new modes and means of communications
and communicating. Simple fact -- Charles wants all of us to
communicate the way he sees it should be done. Sorry Charlie, if I
choose to experiment with something else in a differing manner.

I expect Charles to continue to write things about me that are untrue and out of context on the amateur packet radio network. I doubt that I will be able to respond to more than a few of them since I have a full time job, volunteer as TAPR President, and I am a full time student an the Univ of Texas completing my PhD. If anyone has a question about what I do or what Charles continues to post, all they have to do is write the TAPR office or drop an e-mail message to me at wd5ivd@tapr.org and I will be glad to discuss the issue at hand. Amateur radio should be about change and the first step in change is logical discussions, not attacks such as the one Charles has been conducting for sometime now.

I and others at TAPR work hard day in and day out on projects and kits that amateur radios experimenters and hobbyist can take and add something back to the community with. I am aggravated that Charles continues to feel that the organization that brought packet radio to so many of you is some how out to destroy the world we help create. We see Spread Spectrum communications and other modes in the future as vital to the survival of the amateur packet networking community. Charles sees many of the things that our volunteers are working on as destructive and thus he writes destructive message content about them. Amateur digital communications is in a paradigm shift. The things that TAPR is actively working on are views of the future. The future is frightening to Charles, but shouldnï¿½t be to you. Just check out web page (http://www.tapr.org) for more information and the true story behind what Charles is writing so many lies about.

Sincerely, Greg Jones, WD5IVD
Pres. TAPR

The president of TAPR, Greg Jones WD5IVD recently began a campaigne to eliminate the PART97 prohibition against indecency, advertisements, and communications for personal profit on the ham bands.

He is using his influence as the president of a national Amateur Packet Radio organization, TAPR, to promote this drastic lowering of our standards of decency to further a personal agenda which has nothing to do with the best interests of Amateur Radio.

Greg Jones is the leading advocate of "Amateur Telephone", where Hams communicate by telephone and *pretend* that what they are doing is Amateur Packet Radio. Greg's followers have managed to destroy the integrity of the US Packet Radio Network with this method, undermining and displacing Hams who attempt to communicate digitally via Amateur Radio.
Piece by piece, Greg's "LandLine Lid" buddies have "routed around" genuine Amateur Radio network links with Telephone connections, thereby depriving those who try to communicate with Amateur Radio of the traffic they are intended to carry. This has been the direct cause of the shutting down of many key Radio links in the US Packet Radio Network, thereby undermining and destroying the integrity and operation of that network.

Now Mr. Jones wants to eliminate another of the very foundations of Amateur Radio - Common Decency.

Greg may or may not succede with his campagne to eliminate decency in Amateur Radio as he has tried to eliminate the "Radio" part of the hobby. If he does succede though, I would like to offer my services to any outraged parent or Ham who would like to discuss this matter privately with Greg, but may not know how to arrainge such a meeting. (Track him down)

Anybody can, of course, attempt to reason with Greg now, but Mr. Jones has proved himself to be very resistant to reason. His personal agenda appears to take easy precidence in his alleged "thinking" over the welfare of Amateur Radio, or the best interests of his fellow Hams.

When you, or your child with a Ham liscense is confronted by pornography, SPAM, advertisements and the like on the Amateur Packet Radio network, please keep my offer in mind. If your private discussion with Greg does not go as you wish, I'll be glad to join in and add my own input, if needed.

I am writing to express my concerns about Charles Brabham and, more specifically, his philippics regarding the most brutal schemers you'll ever see. Although not without overlap and simplification, I plan to identify three primary positions on Brabham's values. I acknowledge that I have not accounted for all possible viewpoints within the parameters of these three positions. Nevertheless, all Brabham does is inspire power-drunk ideals. Don't be fooled: The fact of the matter is that the frightful aspect of his holier-than-thou attitudes will create a stir between putrid students and the despicable public at large.

In case you don't know, he has made some dangerous assumptions about soulless hate-filled pseudo-intellectuals. I won't mince my words: Respect for the law is not enhanced by setting the bad example of breaking the law. Even with the increasing number of bitter misguided boneheads, all Brabham does is complain, complain, complain. He blames others for his parasitic deeds, and that's one reason why I'm writing this letter. The struggle against patronizing low-lifes must be a struggle against vigilantism, denominationalism, and egotism, or it is doomed to failure. If I seem a bit slaphappy, it's only because I'm trying to communicate with him on his own level. What is often overlooked, however, is that Brabham's goals are not restrained by any moral scruples.

If Brabham wants to achieve total world domination, fine. Just don't make me barf while he's at it. Brabham, does the word "electrocardiography" mean anything to you? If we let him ruin my entire day, greed, corruption, and interventionism will characterize the government. Oppressive measures will be directed against citizens. And lies and deceit will be the stock and trade of the media and educational institutions. To end on a more positive note: Charles Brabham's whole approach is crapulous.

ï¿½ 1997 TAPR (http://www.tapr.org/tapr/html/presidents_corner.html)

President's Corner, PSR May 1995

I want to spend some time in this issue of my column talking about paradigm shifts. I'll spend some time on organization issues at the end. I have had several members request that I spend more time on higher level issues and concepts in my column, so here we go!

The American Heritage dictionary gives the following definition of paradigm: "An example that serves as pattern or model." Another basic definition of paradigm states that it is representation or distillation of what we 'think' about the world -- but cannot prove (Lincoln and Guba, 1985). Thomas Kuhn (1970) defines a paradigm as a way of breaking down the complexity of the real world. He points out in his book that any field eventually produces anomalies that cannot be fully contained by the prevailing paradigm. This then paves the way for a new paradigm that better explains the anomalies or enables a new phase termed as 'normal' to begin. This change is called a 'paradigm shift.' An example of this might be the change from the geocentric view of the universe to one of a heliocentric view. A classic amateur radio paradigm shift might be that of AM to SSB operations. The problem lies in the fact that the shift from the old to the new paradigm is typically not smooth. The older, established proponents within a field have built their careers around the earlier paradigm, and they normally control the rules by which rules are changed and methods operate. The conflict continues until the emergent paradigm prevails, although usually not until the older paradigm has died, along with the last of the proponents who protected it.

In the past, paradigm shifts took centuries or decades to come fully about. In the last 50 years, paradigm shifts have been decreasing in duration and increasing in occurrence. One example is the paradigm shift from all positivistic research to more naturalistic or mixed method research in the last 10 years. Technology changes have had similar paradigm shifts, such as computers (main frames to personal computers or Macintosh and PCs) and now more recently telecommunications (national networks to home connections on the Internet). The controversy over parts of the recent telecommunications reform act shows some of the rough nature of a paradigm shift, that of the older paradigm trying to slow down the new paradigm by an attempt to control the nature of individual information access. I was attending a recent convention in Austin, where noted Sci-Fi author Bruce Sterling basically pointed out that many of the old paradigm structures are scared, because five years ago it was envisioned that AOL (Sears and IBM) would be the Internet world, nice, neat, packaged and controlled access from home...however, the Internet as it is today, arrived -- not packaged by the

Fortune 100.

Amateur radio is currently caught up in these shifts. The old ways of operational practices are under attack from the new and we will see the frustration in many amateurs during the process. Logic does not prevail in many cases, see some of the comments on RM-8737. Personal interest and power bases are a key to trying to regulate new paradigms in order to stunt their growth. The next 10 years are going to be critical to amateur radio as a hobby. Many hams want more rules and regulations at a time when amateur radio requires less in order to adapt to the next paradigm. Traditionally, regulations are placed on areas that somehow need control or to break up a perceived injustice. The downside to regulations is that they become a large protector of the status quo later on. If we allow other amateurs to place more regulations on what we do now in order to create some assumed equality or operating peacefulness, then we will be stuck trying to change those rules again in the future or possibly have them stifle the growth of amateur radio as a hobby. While a good many amateurs today enjoy operating their modes, in ten years the demographics of the hobby will change drastically. We must be thinking about the future of our, the entire, hobby instead of trying to protect small operating niche we do from day to day. If we do not, then amateur radio might not be around in the form we enjoy today.

There are a lot of ways to look at the future of amateur radio in light of paradigm shifts. What will happen in the next 10 years of amateur radio ? Future studies research says you can't predict the future, all that you can do is prepare different alternate realities and be best prepared for thinking about different directions. Thus, when the future does arise you have mentally prepared for it and can adjust your methods to deal with the new 'perceived nature' of the world. It is a good certainty in one reality that unless we can somehow catch the current technology wave, we will be left behind as a hobby that does things. The last major amateur operational advancement was new digital modes (mainly packet radio), which was built on 1970's technology, and the increase in ATV operations which is even an older technology.

We are now faced with the fact that amateur radio needs to shift to a new way of thinking about what it does. A traditional paradigm shift is in the making, or as we can see, the shift is already happening around us. Many of the things I hear amateur radio touted for are in the past. I have read several times about the fact that at recent events where hams use to provide communications by ham radio, commercial trunking radios and other services have replaced hams. When I was a young ham, I participated in providing communications after the Wichita Falls, Texas tornado. Ham radio was used for several days to communicate information outside the area and provide communications in the damage area. Today, I see amateurs providing short term communications here and there when an outage happens, until more modern commercial systems are brought back on-line or supplemented to handle the additional traffic of the emergency. Another few years, and amateur radio will not even be doing this. I see storm spotters carrying their commercial pagers around to receive notification instead of using their radios. I see people with cellular phones making reports of accidents much faster than we

can do on a phone patch. What amateur radio 'brings to the party' is a radio equipped volunteer group which can be called on short notice and used until no longer needed that use communications outside the commercial systems. There is a niche for amateur radio in all this, but we must be aware of what is happening around us in order to be prepared for what will happen in the future.

I believe that there will still be an amateur radio in the future. However, this could be the sunset or more likely a very cloudy day. Has anyone noticed that new amateurs don't join clubs or social groups like older hams ? Amateur radio is going to change in the near future as compared to what has happened during the last 20-30 years for a majority of hams. I have heard many express this. The number of hobbyist will at some point decrease. I believe that we will see more experimentation and less operational usage in the future as our numbers start down. We will lose more frequencies. Money talks in Washington and with the FCC and we are just fighting a delaying action to keep our frequencies. See the latest news about the analysis of amateur frequencies and their utilization happening in Washington currently. Another thing that must be kept in mind is the FCC could easily deregulate amateur radio. Based on what is happening in Washington and the recent history of the WTB (Wireless Telecommunications Bureau) deregulating amateur radio could be forecast. What would happen then ? With the ARRL and other lobby groups in place, this will not happen for some time, but it could happen.

Thus, how does TAPR fit into this long term? I believe, and thus far have the support of the Board of Directors, that TAPR must be involved in moving to one possible next stage in amateur radio. This is Spread Spectrum development. Spread Spectrum is a classical paradigm shift technology. It breaks all the traditional 'perceived natural' rules of amateur radio. You use as much bandwidth as you need to communicate, you transmit at the same times others are transmitting, and other issues that go against analogy logic. Logic by analogy is a bad way to perceive technology. Currently with Narrow Band technology, many say the bands are 'fully occupied,' but if we take a spectrum analyzer and do an analysis of the band we see that they are hardly every 'fully utilized.' Several have noted this fact. Bob Bruninga, WB4APR, wrote an article in the 1995 ARRL Digital Communications Conference showing another way to try to utilize more of the narrow band frequencies allocations. Robert Buaas, K6KGS, has built monitoring equipment to prove this fact in the supposedly 'very full' spectrum in his area of California. Spread Spectrum is one method in which we can contribute to enhance amateur radio beyond what we are currently doing now on many of the bands.

I can't begin to explain the more technical issues of Spread Spectrum and I am learning as time permits during my dissertation writing, but when leaders in the amateur community such as Phil Karn, Dewayne Hendricks, Robert Buaas explain things I can easily see a vision of where this technology can take us, amateur radio as a hobby. The major point to make is that this will not happen over night. This is a very long term goal to develop and support. TAPR will work on supporting individuals and groups that want to follow our vision. It would be our hope to eventually do something that supports this,

but the future is again impossible to predict.

Spread Spectrum technology will allow amateurs to drastically increase the way we utilize the bands and operate. I hate to talk about visions, especially in this column, because when something is mentioned, people have a natural tendency to think someone in TAPR is working on it and it should already be finished. So -- let me state right up front "This is a pie-in-the-sky stuff." Imagine --- your local club has an Amateur Spread Spectrum box (or several scattered around town). Connected to this box is maybe an RF link to another local repeater, and/or an Internet connection, and/or a phone patch, and/or any number of interconnections. The user, either at home or driving around, has their user radio equipped with a simple selector channel switch. Channel A is the general voice calling frequency. I call Herb, get Herb, and we move to Channel B to talk or maybe Channel C, if B is busy. Let's say Herb and I are going to meet Bill on Channel D, because Channel D is linking several local (metro-area) repeaters via RF links. Then again, let's say we change to Channel E, which is connecting our system to our sister city's repeater several hundred miles away via the Internet. While this is all happening, my computer has been accessing a Web Interface or Eudora at 256Kbps or faster. Then, to make things even better, several such 'organization boxes' can be overlapping and not be interfering. How many clubs would like to have an audio or digital repeater, but can't find a frequency, because the 'band is full,' but 'under utilized' ? Is this one possible reason why many of the traditional protectors of the status quo and recognized power structures are so against Spread Spectrum ? Should amateurs be coordinating operations or managing operations ? Should our hobby be ruled by national regulations or by communications at the local and regional level ?

Does this sound crazy ? Does this sound like I have been drinking too many softdrinks late at night? Is this going to be here soon? Don't hold your breath, but this is something amateur radio could be doing -- absolutely!

Let's think about the above example in technical terms. Simply put, the SS box could be a linear transponder or an SS encoder/decoder of some type. The purpose of the SS box is that of a central link. In addition to providing traditional 'repeater like' operations for small cell-like areas, it is also providing connectivity away from the box. In the example above, the SS box was connected to the Internet (or some other wire line system), had a phone patch, had two or more RF links (in this example one was a repeater link and other was a networking link to the local packet network). The users of the system had SS radios with a selector. As was discussed in Steve Bible's article last issue (PSR #60), all the radios are on the same frequency. The selector just selects a spreading code to be used. Thus the cost and complexity of the user radio is reduced, although the expenses to add SS to the radio does raise the price back up again. How does the voice operations work? In the most simple form, the audio input (i.e. mic) would be translated to a digital signal using any of a variety of methods (check out http://people.qualcomm.com/karn/voicedemo/index.html). By adding FEC (Forward Error Correction) and all sorts of other techniques which are possible, we could have something that could change amateur radio -- do I

hear paradigm shift ?

With this technology, we are able to bring both digital and analog (voice) users together. No longer is the digital mode a second citizen on the band, but is able to provide capability that was not possible 5 years ago. I didn't even mention the capability for this technology for ATV users, EME operators, satellite stations and even weak signal enthusiast ? While Spread Spectrum might appear to be threat to the way many operate -- think about the possible new operations potential of this mode.

This is the reason why TAPR will be working on RM-8737 and other technical issues in the coming years. I can not stress the importance of the involvement of the digital community in the rules process. There were just a few comments to RM-8737 from the digital community in favor of the change. The opposition to changes in the rules are getting organized and we need to do the same. While TAPR can move the process forward working with the ARRL and others, it will eventually come down to who submits comments to the FCC. If amateur comments in favor of change are in the majority, the FCC will change the rules. If they are not -- then we will be very limited to what the future will hold with expanding this mode. If you want to get involved with the process, keep an eye on both the Spread Spectrum Special Interest Group and the Spread Spectrum Web Page.

I have been thinking about a lot of the items mentioned above for some time. Writing it all down has been a catharsis and I hope that it allows others to think about the future of amateur radio as a whole.

I was looking through an old magizine and I found a product that would let you plug in your 14.4 modem(the fastest they had at the time of printing) into your radio. It was called the T-Link 2300(made by SYSCOM???). Since telephone modems ONLY can use 4Khz of bandwith, you would create a very narrow signal. Anyone ever used these or know where to get them? I would love to use something like this on ham radio. It says it is point to point or point to multipoint(both full duplex).It also says it would work with conventional or data radios.

>I think we ought to be told .....

Heh, heh, yes it does, as does a NETROM packet switched network, and
as does an IP packet switched network. That's what packet networks do.
Packet networks are layer 3 functions. Ideally, they function transparently
with regard to link layer and physical layer issues, and are transparent to
the transport and application layers above them. (In terms of network
performance, however, we have to consider all the layers in the system
design to ensure adequate capacity and sufficiently low latency.)

BBSs don't live at the packet switched level. They are application programs
which forward messages and bulletins among themselves, ideally without
much regard for the underlying transport, network, link, and physical layers.
If they are designed properly, and the layers below them are designed properly,
they needn't care about packet switching. That's handled transparently at the
network layer. The BBS just deals with character streams.

That *should* be obvious. BBSs don't require packet. They function just fine
over non-packet links too. That's because they are application layer programs
and shouldn't care about the underlying network technology which links them.
If this weren't true, Charles couldn't be complaining about "Landline Lids". So
Charles' complaints have nothing to do with packet networking, despite the
smokescreens he tries to throw up about that.

And frankly, some of us who care about packet networks don't care about
BBSs anymore, and that seems to torque Charles off too. Too bad. His BBSs
are just user applications, like any other, and IMHO deserve no special treatment.
If he wants to utilize packet networks, he can (we've never locked anyone out),
and if he prefers to use dial up landline, he can do that, it's his BBS. And if he
wants to play Lockout Lid, he can do that too. It doesn't make much difference
to the majority of our users, who no longer use BBSs anyway.

The BBS is no longer our primary network customer, and hasn't been for quite a while (I shut mine down in 1983). Our primary customers (the LAN members who fund our efforts) say they want near realtime network services, and that's what we're trying to deliver. We can't do that on a national level for a number of technical and non-technical reasons (the least of which is that GRAPES isn't a national organization), so we're concentrating on doing it at the local and semi-regional level where we can keep latency low and throughput high. That seems to disturb Charles too. Too bad.

Packet network builders never promised to deliver a global low speed low capacity network *in perpetuity*. That was attempted at one time (we, along with FADCA and ALANET, initiated Southcom in 1980 to do that in the Southeast), but it didn't prove to be very capable of meeting changing user demand, so we have redirected our efforts to where we can do more to meet what our LAN members say they want. They pay the bills, so they get to call the tune. When Charles starts paying the bills for our network, he'll get to call the tune. But until then we'll just have to muddle along doing what our users tell us they want.

What they say they want is a fast packet switched network, so that's what we give them. How they use it is up to them, we don't provide applications such as BBSs. If a user wants to do that, he can, or if he wants to put a webpage server up, he can, or if he wants to run digital voice, he can. Our charter is to just move the packets in our service area.

Here's Greg's original posting, complete. TAPR maintains an archive of their SIGs, for those of you who would like to verify this.

You will see Greg suggesting that PART97 related to content be subverted into uselessness, as he claims I have "lied" about.

-------- transcript begins -----------

>

Well, it is time for all of us to write the FCC and let them know that digital communications shouldn't be treated any different from phone

patches on repeaters or other modes. The operator causing the problem should be only one held responsible for acts which are clearly defined as being bad within the rules.

Now, if the gateway owner knows about this and doesn't take measures after the fact to stop the usage, then the gateway operator probably is at fault at that time, but the last ruling the FCC issues regarding first hop and end user was awful.

Anyway, the rules are in flux. Time to write comments and points now.

I know I am.

Cheers - Greg

Greg Jones, WD5IVD Austin, Texas

---------- transcript end ----------

Comment:

I think all adult Hams in the USA know exactly how vigorously those rules are enforced in reality. - Hardly at all.

It's also pretty plain from Greg's posting exactly what he is talking about.

Greg Jones wants "First station transmitting" responsibility to be removed from the PART97 rules, so that Amateur TCPIP stations can offer unrestricted Internet access, and suffer no penalty when pornography,ect. ends up being transmitted on the Ham bands regularly, as is inevitable if Greg gets his way.

He's hoping to flood the packet net with this crud, so that the FCC will toss their hands up for Amateur Radio as they did for CB.

His "reason" for advocating the lessening of our standards of decency is so that he can promote Amateur TCPIP.
His insistence upon Hams using the Internet to communicate in preference to Radio for our "Amateur Packet Radio" communications is also motivated by a desire to promote Amateur TCPIP.

My contention is that using Radio is more important to us as Hams than Amateur TCPIP could ever be, as are our few remaining standards of decency, put forth in PART97. Those standards need shoring up, not elimination.

I stand by my offer. When outraged Hams or parents of young Hams want to discuss the lessening of our standards of decency with Greg, I'll be glad to give them a hand. I have children too. One of my kids wants to be a Ham, and now I cannot be sure if that's where I want my kid to be. Thanks to Greg Jones and TAPR.

If this goes through, do not forget who promoted the idea and encouraged others to do so, and what organization he represents. Greg Jones, president of TAPR.

The only way pornography will "flood" the packet net is if Amateur operators
actually take
part in spreading it. The same with the manners of CB operators. You are
assuming
that hams will spread pornographic material if allowed.

If the general ham population has nothing better to do than exchange dirty
pictures then
what's the point in your argument? There would be no need to reserve the
frequency spectrum,
you can all share the CB band with everyone else and let the spectrum be
used for better purposes...

Actually, Charles, this is the first I've read on this thread that makes ANY kind of sense. Like everyone has been trying to tell you all along: The reason the network is dieing is from lack of USERS! Unless we find something the USERS think is worth doing there WILL BE NO SUPPORT.
Right now I'm maintaining a network 6 dual-port nodes and a BBS virtually unaided because I love packet. All but a few of my users have left packet because all there is to do is read "wants" that are usually too old to be of use and poorly thought out "debates" on the BBS. My biggest user left 6 months ago when he found out there was much more trading being done on the internet and that replies to wants/for-sales got there in minutes instead of days.
(Right now the stuff from you and Hank make up about 20% of the total traffic volume. I've yet to see anyone but me read them, and I skip yours 90% of the time because you never come up with anything but insults.)
Right now, the only way I have of justifying the network is as an "emergency" link from the Texas Gulf Coast for Hurricanes and for the yearly canoe race is covered by it for the last 150 miles. **

What we need more than anything is something exciting to DO with packet.

I'm currently tring to work up an affordable real-time weather system for that will allow local hams to put their unused stations to use. I'm hoping that the promise of having access to wide-spread real-time conditions will be enough of a "carrot" to get some of them back on the air.
It isn't much, but it's the best I've been able to come up with so far for a very large, mostly rural area.

To the group in general: No, I'm not dumb enough to believe that this will change Charles' mind in any way, or elicit anything constructive from him. He is a true believer in a his religion and will not be swayed. Instead, I hope that others who are interested in seeing packet again become a popular mode will help in the search for a "perfect use" for the mode.

73 to all,

de Harvey, WB5MCT

** The Texas Water Safari, held each Juneand billed as "The World's Toughest Boat Race" starts in San Marcos Tx. and ends 260 river miles later in Seadrift Tx. on Lavaca Bay. Hams from all over Central and South Texas track the progress of the contestants and provide health/welfare warnings to race officials on persons who are overdue at a checkpoint or who are reported to be in trouble. For the last 5 years

or so, packet has played a major role in this. A central server running ARES Data (an old, simple and robust multiconnect packet database) us used to maintain a database of all reported positions.

3927. FBB in the room network?

Hello gentlemen,

I starting FBB5.15c on a 286/2MB box. I have the USCC>4 card carrying TCM3105 (1200bps) and AM7911 (300bps) modems, gotten to work via TFPCX driver. I also think to replace TFPCX with PC/Flexnet if it will fit into 286/2MB computer.

Well, now the problem is as follows: this configuration is about to be a "server" in the local school ham club. Beside the USCC, there I have one COM and two LPT ports. One of the LPT's will be used for local printer, so one COM and one LPT will be left. Recently I got another 286/2MB box from the school authorities, intended to be a "client" (ie. terminal for kids' use only. They are not supposed to use "server"). The second computer has only one LPT port installed at the moment. Probably I will make the first tests with LPT's.

What I want to do is to link two computers in a way, my students will sit at the console of the client, access the FBB in a way and permissions of the normal users, read/write mail etc, and (if permitted) to use access to one or more FBB's frequencies. Now I wonder if it is needed to have the node (either virtual or physical) installed in FBB box, or there is the simpler way to access some of server's services from the client?

I already tried the BPQETHER package, BPQ itself, ethernet card connections etc, but it seemed complicated for me to manage all that stuff working.

Any suggestions?

Misko YT7MPB

Charles, on this one you missed the point.

The existing rules cause any potential liability to be shared between the first transmitting station (the user who puts the message on my BBS) and the first forwarding system (me). i.e. some malevolent person could, for example, stick a bunch of bulletins onto my BBS, full of good old four letter words, wait until my system forwards them, and then notify the FCC that I was in violation. This happened to me. FCC chose not to get involved because they did not actually MONITOR my transmissions. The ham involved (who posted those messages) is still on packet, but his messages no longer are transmitted by any of my radios.

> THAT's why you want "first transmitting station responsibility"
> eliminated... Because you KNOW that unrestricted access to the Internet is
> just that, and that allowing such on Packet will bring on a flood of
> inappropriate material into the packet net.

It's not "first transmitting station" liability Greg (or anyone) wants to remove, but "first forwarder liability". What we really want is the usual common carrier protections, but even saying those words during the meetings proposing the LAST rule changes almost got me kicked out of the room. Wasn't politically correct at that time. Might fly now though.

Without any problem. They are mostly idle, as is the packet network.
Um ... should explain that I don't mean HF *packet* but CLOVER and
the various TOR systems. I have two such systems on air, and they get
perhaps 5 - 10% utilization. They could handle a LOT more traffic, and
support a LOT more users.

> I've been around
> HF long enough to know the answer, and so do you.

Good, you know the answer is "easily".

There is more to this discussion though. Our HF bands are pretty empty
most of the time. I took the summer off this year (sabbatical) and have
had plenty of time to work HF. It's pretty quiet out there, particularly
on 15M and higher. Heck, it's not just pretty quiet, it is almost deserted.
We could make MUCH better use of our HF frequencies, particularly on
15/12/10 meters. Anyone want to try? I'm available ... on CLOVER and PACTOR-I.

I've been trying calling it "The Ham Radio Digital Network", as a catch-all, but dunno if this term would ever catch on. Calling it "The Packet Net" is not as accurate as it once was, and is obsolete but with no generally accepted replacement.

I hold locally originated bulletins for review, due to that rule. I've never had to zap one, but then again I live in a rural area and the local Hams are pretty friendly. The few bulletins I have had to zap were forwarded to me from another BBS, not originated by a user of my system.
Maybe that seems like a lot of trouble... The way I look at it, my efforts in that area are more than just a case of CYA... I feel that I am doing my small part to "keep it clean" for my fellow Hams. The "crud" has to stop somewhere.

>FCC chose not to get involved because they did not actually MONITOR
>my transmissions. The ham involved (who posted those messages) is

Can't blame you. I have not seen much evidence of systematic enforcement by the FCC. No need to list examples, as everybody has their favorites and tastes vary.

Then I suppose you believe that Greg wants things set up so that when an Amateur TCPIP station offers unrestricted access to the Internet, some

malevolent person could, for example, view a bunch of nasty usenet postings, xxx graphics, xxx webs sites, ect. through the gateway, full of good old four letter words and worse, wait until the system sends them, and then notify the FCC that the SYSOP was in violation.

Requesting those things could easily be done without an illegal transmission, of course. The request itself would be unlikely to contain illegal content, especially if the request is a "mouse click". As I pointed out earlier, how can any Ham know ahead of time what is or is not "nasty" ahead of time when accessing the Internet? A recent posting on this newsgroup by Steve Sampson is a good example.
Clicking on a URL to go to a particular Web Site, or clicking it again to download a nasty graphic would not involve transmitting "nasties". The content of the user's request could easily be legal, and cause the gateway to do something VERY illegal - IF "first transmission" is retained.

Recieving the nasty stuff would not be illegal, either. Only the "first transmitting station" is liable. (The gateway)
If not noticed and stopped, your malevolent person could play this game all day, in case the FCC wasn't monitoring during the first report.

Re-read Greg's original post, and see if you still believe "first forwarder" is really what he is wanting to eliminate. Ask yourself, "How does the 'first forwarder' rule affect Amateur TCPIP, which does not even use store 'n forward?" There is no mention of "forwarding" in the post at all, and forwarding is not the topic of discussion. Unlimited access to the Internet through a gateway is the topic, and how inconvenient the regs are for that purpose.

I say he's talking about "first transmission", not "first forwarder".

Well, it is time for all of us to write the FCC and let them know that digital communications shouldn't be treated any different from phone patches on repeaters or other modes. The operator causing the problem should be only one held responsible for acts which are clearly defined as being bad within the rules.

Now, if the gateway owner knows about this and doesn't take measures after the fact to stop the usage, then the gateway operator probably is at fault at that time, but the last ruling the FCC issues regarding first hop and end user was awful.

Anyway, the rules are in flux. Time to write comments and points now.

I know I am.

Cheers - Greg

Greg Jones, WD5IVD Austin, Texas
wd5ivd@tapr.org http://www.tapr.org/~wd5ivd

---------- transcript end ----------

Greg wants "the operator causing the problem" to bear the burden, not the "first transmitter" of illegal content.

By the way, I agree that "first forwarder" is something we could get by without just fine. - But I do not believe this is what Greg has in mind at all.

Charles what's the effective throughput of the HF digital setups? Could they
suddenly deal with let's say a 30% increase in users? I've been around
HF long enough to know the answer, and so do you. Worldwide the setup
isn't either. Most of the world also isn't interested in HF digital or relying
on
it, and by world I mean licensed hams around the world. Yes there are
folks in isolated locations who might benefit from HF digital, folks on
yachts and the like, but if suddenly just the folks who regularly post on
here began putting messages on the HF digital network as you put it, it
would be a substantial increase in traffic. I've played with HF packet,
rtty, amtor and even pactor, HF packet doesn't work, Pactor does, so
do GTOR and PACTOR II, but the infrastructure isn't there for lots more
hams to use, and it's not likely to be there either.

Satellites right now with store and forward are too busy in populated areas,
while a ham in the right portion of Africa pretty much has them to him or
herself.
Even satellites could not deal with a lot of emergency traffic.

One more time, rebut what I say, rather than indulging in personal attacks.
If you can't convince by logic, insulting sure won't work!

But what I wrote and what you created as a message are two different things.
You accused me and TAPR of starting a campaign to change the rules to allow
porno on amateur radio. What @#$(*@# on your part.

I was saying in the TAPR NETSIG message below, that digital communications is
held to a different set of rules then any other traditional mode.
Look at the various BBS forwarding rules that are still in effect.
We finally got the third party traffic rules changed for the better after
several years of trying.

It is time that rules apply to all modes equally. Nothing more and
nothing less did I write about. If you can't read that in my
statement, then I might suggest some ESL classes.

Glad you are reading the SIGs still. I remember you as the person who said he
would never read another TAPR SIG.

Cheers - Greg

: way.

I don't see how this really differs from a repeater phone patch
operation in which a ham could call up a phone sex number. Common
sense would suggest that the originator of this call is the culprit.

Why should it be any difference if a ham requests messages from *sex*,
erotica etc. newsgroups or web pages, it should be as clear that the
ham making the request is the culprit. It is of course very important
that the requestor can be reliably identified e.g. through
authentication.

The situation would only be problematic if we assume that the contents
of the "internet" (or the whole news feed) would have to be duplicated
over radio to all BBSs served by a gateway.

As long as the latency time between the end user ham and the gateway
is reasonable, there is no need for such duplication of data and all
actual transfers of data only happen on the request of the end user
licensed amateur. With strong authentication, I do not understand how
this would be more problematic than a phone patch.

Due to spammers, the individual ham would have to be careful what to
download from a news group and select the messages individually from
the list of subjects.

>

At least someone understood what I was saying. Thank you Frank.

The issue here deals not with the rules, but with the responibility
of amateur radio operators to hold up the rules as individuals.

Obviously Charles and myself have two different approaches.

I believe that you put the minimum set of rules in place that are needed
and handle cases of rules violation on a case by case basis, since
those worse breakages are normally going to be few and far between. If a
rule violation is in wide spread use I can expect the FCC will be changing
the rules to make it legal again. The rule changes several years
regarding amateur clubs doing public service for profit events comes
to mind as a case in point.

I'll let you decide on how Charles thinks the rules should be written.
My guess is that he feels they should be written as to restrict all
sorts of things that would further restrict many of the things Charles
believes will somehow end amateur radio.

Nothing any individual or group does will kill amateur radio. I expect
it to continue for some time to come although in a different state
over time as we see it today.

Charles, if you want even more strict rules regarding what some of us want
to do, all you have to do is write a rule making and send it into the FCC.

As someone suggested at a national conference years ago, after a while
you just want to switch over to all Part 15 communications because you
can get away from people trying to tell you what you should and shouldn't
be doing all the time. After reading and defending myself from Charles'

continued statements I can see why this amateur would have suggested this a few years ago. Maybe we will just see the best and the brightest find some where else to operate and we will see amateur radio bite the dust becuase of the efforts of Charles.

I plan on sticking around for several more years and having my impact -- if any to make Charles more happy about the way things are going :-\

Source record: 22472
Cross-posted to: rec.radio.amateur.digital.misc,alt.ham-radio.packet,alt.radio.digital

Even though the modem signal may be limited to 4Khz bandwith, the RF signal from the transmitter will be much wider, depending upon modulation type. In general, what you get is not considered a narrow bandwidth signal and it will exceed the FCC maximums for the bands at least up through 2 meters. Telephone modems usually require a full duplex two-way link so you'll need two RF channels. If you try to T/R switch them you'll run into timing error problems with a typical telephone modem.

No, I am assuming that Greg Jone's LandLine Lid buddies will do so if allowed. On of these clowns lives nearby to my location who literally is a pornographer. This clown has a R-W CD ROM drive, and uses it to publish filth he gets from the Internet for profit. This same Bozo was heard on the local repeater a few months ago, offering to make CD copies of Win98.

Do you REALLY think that such scum will hesitate to use Greg's new "anything goes" setup?

Grow up.

Greg's LandLine Lid buddies have made it plain that PART97 is too restrictive for them. My opinion is that rather attempt to downgrade Amater Radio to their level, they should just move on to another service alreadyt set up according to Greg Jone's ideal - That's right! I'm talkning about CB Radio.

>If the general ham population has nothing better to do than exchange dirty

Replace "general ham population" with "LandLine Lids", and your statement will have hit the nail on the head exactly.

Ask yourself, " What radical splinter (sphincter?) group in Amateur Radio is along in calling for a reduction of our standards of decency?"

THAT's the group which will be going for the porno, not "Joe Ham".

That's cool, Greg. Hey, keep an eye out for those gang-bangers. They play pretty rough, and have no particular sympathy for geeks. I'll specify "no broken bones", but you know how it is... Those silly kids sometimes get carried away when they are having fun.

I am eagerly awaiting your confimation that you are willing to back up your mouth with your butt. Either you believe what you are saying or you don't. Which is it, Greggie-poo? It's your call. I'm ready on my end.

>
>Glad you are reading the SIGs still. I remember you as the person who said
he
>would never read another TAPR SIG.

Nope. I said that the TAPR SIGS are not worth serious consideration because of the "country club" aspect of TAPR, in conjunction with your cowardly censorship. I watch the TAPR SIGS just to keep an eye on the LandLine Lids. One thing I've noticed about you and your Lid buddies, Greg, is that you JUST stupid enough to forget that anybody can read the TAPR SIGs, not just the ass-kissers and Lids who you have allowed to post there. That's pretty handy, and it's funny to watch them parrot the LandLine Lid "jingoes" back and forth with each other, as a substitute for thought.

1. The "rules" are barely enforced, as cynical Greg knows well.

2. Greg's proposal will FLOOD the packet net with inappropriate material,
which is precisely why he is trying to eliminate the responsibility for such
by a further watering down of PART97.
If Greg himself did not believe this, he would have no motivation to pursue
this matter.

> If a

You haven't given this much thought, have you Paul?

Once you read a message via Packet Radio, it in ON THE AIR, whether you end up reading what you thought you were getting or not.

THAT's why you want "first transmitting station responsibility" eliminated... Because you KNOW that unrestricted access to the Internet is just that, and that allowing such on Packet will bring on a flood of inappropriate material into the packet net.

If you, Greg, and the other Lids were not utterly certain that unlimited Inet access on packet would not bring this on, you would not be seeking to protect yourselves by eliminating personal responsibility.

Hey, anybody can put the tiltle "Need help with TNOS" on a usenet message full of filth.

Grow up.

Steve Sampson wrote in message <8G9N1.2922$Pb.9190865@news.goodnet.com>...

As as often been the case, Steve Sampson has again come to my rescue to prove my point for me.

>and the Hitler youth himself, Charles. Who says being a
>leader would take too much time. Fuck you then, move over,

Well, Greggie-poo, will your new "no rules" system make, let's say, THIS NEWSGROUP available to Hams? If a Ham does not know Steve Sampson, what is to prevent him from reading one of Steve's posts over the air?

How would ANY Ham be able to know that he is about to cause foul language to be transmitted when accessing Non-Ham material such as USENET ?

Now, Greggie-poo, tell us again how your proposal will not bring a lot of filth into Amateur Packet Radio??

;-)

You're probably right, but it might be fun to give it a whirl irregardless. Does anyone have a good way to interface the telephone line to an HT? There has to be some impedence matching and some stuff to make the modem happy - beyond my abilities.

Cheers-
-Mike

Greetings

I started off with 9k6 by trying to use V29 4 wire leased line modems.

First off, the signal to noise ratio of an RF link is nothing like a wired
circuit so I had a problem there.

Secondly, the QAM modulation requires a linear phase response
which was next to impossible to achieve with the radios I had available.

What really killed it was the training time of the modems. The original
pair I tried wouldn't work at all in half duplex - even on the bench
wired back-to-back they wouldn't train up. I eventually found some that
would train without the use of training tones but they took over a second
do lock onto the incoming data stream - thats a lot of lost data at 9k6.

Result - I gave up entirely with the LL modems until I came across
a car load of V26 2k4 modems. These are designed for half duplex
operation and phase modulate a 1800Hz audio carrier at 1200baud.
The ones I found (in a skip) use V27ter scramblers which makes the
best use of the audio bandwidth.

The dibit encoded data stream carries the 2 bits per baud to get the 2k4
and I've yet to find a rig that *doesn't* work with them. On 70MHz, where
the channel spacing is restricted to 12.5KHz, on a crappy old phase
modulated ex-mobile radio I get 160 bytes/sec easily. The interface
is simple enough - basically a VOX operated by the modem audio
output when it is keyed by raising RTS.

The repeatability is great - having a pile of modems all the same, if
one dies then next one will work without fiddling with dev levels or
anything.

Cheers

<more deletia>

Seems a bit more on topic ...

We played with something similar to this a few months ago.
I wrote a little packet switch (for Gary: not a router, and actual switch)
that could move UI frames around the area very rapidly. The idea was to be
able to "broadcast" emergency weather info to various places across a
100 x 200 mile area, using existing packet resources. The idea worked
fairly well, but we found very little interest in the service, probably
because we don't get much serious weather. i.e. a little frost in the
winter is "serious" as are winds above 30 mph!

Would be interested in what you come up with. Please post it to the
packet network, since the folks who need to know about it do not read
these newsgroups.

Exactly.
My point during the crafting of the existing rules was exactly the same: each ham must be responsible for their own behavior. Holding the first forwarder responsible was, at best, silly: it makes me liable for actions taken by users of my servers. Think "chilling effect" here ...

Oh sorry, didn't mean to upset everyone by being in agreement with Greg

3949. Congreso RedURE Zamora'98 - Comunicaciones Digitales y v&#65533;a Sat&#65533;lite

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-22 00:00:00 UTC
From: Al Quiroga <ea1bk@amsat.org>
Message-ID: <6u6lem$j68$1@talia.mad.ibernet.es>
Source record: 22339

Hola OM:

Ya podemos informar de los precios y programas definitivos del Congreso RedURE Zamora'98. Podeis ver las nuevas noticias en la p&#65533;gina Web de AMSAT-EA en la direcci&#65533;n de costumbre:

http://aintel.bi.ehu.es/~amsat-ea

all&#65533; est&#65533; el enlace al Congreso RedURE Zamora'98 con las siguientes nuevas informaciones:

-Programa definitivo para los Congresistas.
-Programa para los acompa&#65533;antes.
-Men&#65533;s de las comidas y cenas.
-Precios.

Como hay mucha gente interesada en saber los precios, te adelantar&#65533; que el Congreso, llegando el s&#65533;bado por la ma&#65533;ana y saliendo el l&#65533;nes antes de comer, sale por un precio especial de 21.000 pesetas / persona en habitaci&#65533;n doble. Para los que vienen solos y no quieran compartir habitaci&#65533;n, hay un suplemento de 2.150 pesetas / noche. Para las parejas mejor avenidas tenemos un n&#65533;mero limitado de habitaciones con cama de matrimonio, as&#65533; que si sois de entre ellas haced la reserva pronto indicandome esta circunstancia.

Para las dudas, consultas y reservas es muy importante que os pongais en contacto conmigo cuanto antes por cualquiera de los m&#65533;todos indicados abajo.

Para la gente que no tiene transporte desde su lugar de origen se pueden gestionar huecos en coches de otros asistentes (tambi&#65533;n hay que contactar con EA1BK).

Ense&#65533;ale a tu XYL el programa para los asistentes, y si sois de buen paladar y mejor comer, no dejeis de leer los men&#65533;s que hemos preparado.

Queremos que el Congreso RedURE Zamora'98 tenga un buen nivel t&#65533;cnico, pero adem&#65533;s que tu y tu pareja os lo paseis lo mejor posible.

No olvides hacer vuestra reserva cuanto antes. Hasta que nos veamos en Zamora:

3950. 1998 Canberra Technical Symposium

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-22 00:00:00 UTC
From: Waldis Jirgens <waldis@effect.net.au>
Message-ID: <3606fd28.0@dingo.effect.net.au>
Source record: 22340
Cross-posted to: aus.radio.amateur.digital,aus.radio.amateur.misc,rec.radio.amateur.digital.misc,rec.radio.amateur.misc

The Canberra Amateur Packet Radio Group (CAPRG) in conjunction with the VK1 WIA will present the 1998 VK1 Amateur Radio Symposium

On Sunday November 22 at the Charnwood Scout and Guide Halls commencing at 0900 hrs.

There will be two streams of presentations, and some of the planned topics for the day are:

Amateur Radio and the Year 2000 Olympics
QRP Operation
Building an 80m Transceiver
What is the Print Handicapped Radio Station?
Analogue Satellites
TPK for Beginners
PACTOR
SSTV
Digital TV
Tracking Down Radio Interference
APRS

A presentation pack, lunch, and morning and afternoon teas will be provided in the $25 entry fee. An early bird entry fee of $20 is available up until 10 November 1998 and can be obtained by sending you name, address, callsign and $20 to VK1KCK at 17 Ogden Close FADDEN ACT 2904.

Hopefully we will get enough interest for a fox hunt or two on Saturday afternoon, and if so the planned start time and location will be advised in a later broadcast.

There is still room for a couple more speakers, so if you wish to help please get in touch with Mike, VK1KCK.

A partners' tour, visiting various Canberra tourist-attractions will also be arranged. The tour will co-incide with the symposium, so your better half will be entertained too, whilst you attend the technical presentations.

And if you have any questions relating to the Symposium please get in touch with Mike also. Mike can be contacted by e-mail at mikew@netspeed.com.au, by phone at (02) 6291 2552, and by snail mail at 17 Ogden Close, FADDEN ACT 2904.

I was always surprised that the FCC made the final decision they did and
was even more surprised when the wouldn't consider the petition for
reconsideration on the subject. The petition was strong enough, the
FCC just wanted to forget about the whole subject and move on to other
higher priorities.

This is what always worries me when I see people wanting to add stuff
to Part 97. Once a rule is added it takes years and years to see
them get removed or changed if they are messed up. Look at the
rules on SS hardware sequences which are now almost useless since
common chip sets don't implement what the FCC finally allowed.
Part 15 rules have changed several times to take advantage of technology
changes, but Part 97 SS rules haven't changed once and we are currently
3-4 years into the current rule making to allow us more flexibility.
One of the several reasons we are behind on that technology curve.

When I see the FCC talking about stream lining the rules, I don't think
they have the same definition as we do.

Cheers - Greg

: Hey, anybody can put the tiltle "Need help with TNOS" on a usenet message
: full of filth.

Do you allow transfer of binary files through your BBS ? Do you decode
every Locator.exe locator calculating program, run it and test all
possible key combinations for possible "Eastern Eggs" that might
display a filthy picture or extracts from the Starr report ? Maybe
some of your local users are just doing that and waits until the
bulletin has been forwarded and reports to the FCC :-).

Seriously, I don't think misleading headers are going to be any more
serious problem than hiding some other information in non-text files
in current BBS transfers.

As long as the requestor is well authenticated and the requests are
logged at the gateway, the hams using such gateways would be very
careful to avoid questionable links or headers and if mistakes happen,
say due to misleading headers, the rate would still be _much_ lower
than certain four letter words at 75/80 m or 2 m repeaters.

I take it then that you are ready to go on record saying that Ham/Internet gateway operators should continue to be personally and directly responsible for the content of any Radio transmission their station may make, irregardless of who or what may have "triggered" that transmission, or selected that particular content?

If so, we may have a meeting of minds here.

I think that is exactly the point. When a message is first entered
into the ham radio BBS network (see the FCC definition ..) that ham
transmits the information over the air. Doesn't matter if the ham
got the information from the internet, got it via a voice telephone
call, typed it into the message herself, they are the first to transmit
it over ham radio, and are liable for it's content per usual Part 97 rules.

Let's say they transmit it to a BBS system, and that BBS system forwards
the message, or some user of the BBS system reads the message (causing
the BBS system to transmit it). If it is the FIRST BBS system in the
forwarding chain, the control operator bears joint liability with the
ham who originally transmitted it to the BBS.

This is what many of us object to ... holding person B responsible for
for the actions of person A.

If you can dig up a COM card for the second computer you should be able to use the Baycom driver for BPQ on the server and run the Baycom program on the client. A simple 3 wire cable cross connecting the transmit and receive lines from the two COM ports would compleat the setup.
In operation, the system would look exactly like you were using Baycom to access the BBS via radio.

I have a feeling that I was right, all along. I predict that if Greg replies to my question at all, it will be with one of his long, drawn out, semantically nulled-out "weasel-grams". He'll take at least 5k to say absolutely nothing, and attempt to create a cloud of ambiguity around his intentions and actions.

Enjoy!

Discussions of this nature always turn to conversations on rules and regs
rather than actually how to get the stupid thing to work. FYI, I have a
really cool ethernet connection in my dorm room at 10Mbps. So far I've
figured out how to get a dial-up to packet gateway working, hardware only,
quite simple really. But how can I gateway to an ethernet connection? I have
a couple of slow speed 1200 baud TNC's and one 9600 baud to use with it. I
also have some 56k hardware.

Hmm, it seems like the task of censorship is unreasonably big and, as is the case with the entire amateur service (except when the fcc steps in), it is more or less on the honor system. Of course the phone patch operator or gateway operator must take responsibility for disconnecting his service until abusers can be dealt with. I am sure a hundred hams in their winnebagos would be glad to help a sysop having troubles with an abuser if he asked. Let's not hinder the technology by insisting on strict rules. Get it working first and work out the kinks later.

I've gotten a used dual port KAM that came without a manual.

Is there anyplace to download a copy of the manual?
A quick diagram of the HF and VHF radio wiring connections
would help get me going

It has version 2.72 firmware installed. Back in the deep recesses
of a dark desk drawer, I found a KAM version 3.0 chip. Any info on
what modes these old versions support?

Any information will be useful.

Thanks - Dave.

>and you are hoping that by creating fear of unlimited liabilities, you
>can get your way.

Read PART 97. Those liabilities already apply to gateway operators, just as
they do to all Hams.

Being a gateway operator does not excuse you from the regs. Sorry.

By the way, I like gateways just fine. - When they are run legally.

>
>But your assumption that prohibiting indecent transmissions makes
>implementing Internet/amateur radio gateways difficult or impossible
>is simply wrong. If anything, it's much easier for Internet/amateur
>radio gateways to implement indecency restrictions than for voice
>repeaters.

Sounds great to me. That's what I have been advocating.

>
>The danger of your kind of approach is that it might create unintended
>consequences for all repeater operators. If a repeater is used in the
>commission of a crime, could stricter FCC language hold the operator
>"personally and directly responsible" and be held liable for damages
>to victims?

Of course, but only in the rather unlikely event that the repeater was the
"first transmitting station".

"My kind of approach", by the way, is plainly laid out in PART97. It
applies to all US Hams, not just myself.

>
>Responsibility should be limited to cooperating with the FCC and other

>enforcement agencies in stopping repeated violations of FCC policies
>through the repeater or gateway.

That will not be neccessary in those cases where the gatewayy is the "first transmitting station" of the illegal material. In that case, the gateway operator is solely responsible. - And that's what Greg Jones wants to change.

Thanks for helping clear that matter up. Some people thought I was wrong when I said that Greg was wanting to eliminate the responsibility of gateway operators for their stations' transmissions, as laid out in PART97.

>All other responsibility should lie
>with the abusers themselves. Your simplistic "get tough" approach
>endangers all of amateur radio.

The first station to transmit illegal content is, indeed, the abuser. - And that's where the responsibility lies.

No need for gateway operators to "assign responsibility" .. PART97 has
already cleared that matter up. The first transmitting station bears that
responsibility.

"First Hop" too, but hopefully we can get that cleared up.

>Authentication can be
>implemented securely over an open channel using one-time passwords or

Not to mention the fact that transmitting pornography will cost you your
liscense.

Greg wants to remove that responsibility that goes along with being a Ham,
making the widespread introduction of all types of illegal content,
including pornography on the Ham bands a certainty.

>
> > My contention is that using Radio is more important to us as Hams than

>occur.

Wake up and join the rest of us in the late twentieth century. My FlexNet
station monitors EVERYTHING on the air, including IP frames that
NetRom/BPQ/ect. do not.

If you really like IP over Radio, you owe it to yourself to look into
FlexNet. There's info at my URL, listed below.

>It takes excellent conditions for reception, a lot of
>networking expertise, and a lot of time to intercept commonly used
>TCP/IP transmissions.

Maybe five years ago it did.

> Unless you have a prurient interest in what

I think you are attempting to cover for Greg while he works to eliminate gateway operators' responsiobility for what their stations transmit. - And not doing a very good job of it.

Thanks for clearing these matters up. Many people had been given the idea that I was lying about Greg's intentions.

I commented on what the rules say as they are now constituted, and also
on some of the events leading up to those rules. I did not say anything
about my understanding of Greg's current position. He is free to comment
on his position if he wishes. Please do not speak for me, I can do that
small chore myself. Works better that way, because I will always state
my actual postion <smile>.

Again: I did not say that I understood Greg's position.

> I would like Greg's position concerning "first transmitting station" spelled
> out for me. That is my request, exactly.

Would be good to continue this discussion, since it is clear from many
of the responses that the details are not well understood.

> Greg mentioned everything except "first transmitting station" in his posts.
> Look it up.

One issue unresolved from the meeting and discussions which lead to our
current rules is the issue of "control operator". A point I made at the
meeting (but only in passing because it is a bit obscure) runs roughly
as follows. Let's say I connect to a local BBS system and cause it to
transmit certain data to me. Say that BBS system is under automatic
control (the owner and all usual control operators are not physically
present at the station). Am I the control operator? If we look at history,
the answer is no. Consider the FCC's position with respect to voice
repeaters for example. However voice repeaters do something quite different
than a BBS system: they retransmit the actual transmission of the station
using them. BBS systems do not do this. There are only two stations involved
in any interaction with a BBS system with respect to actual RF transmissions,
where there are normally three stations involved in the case of voice
repeaters. So perhaps one useful interpretation of a user connecting to
a BBS system is that user becomes the control operator of the BBS, as well
as the control operator of his own station, and it thus responsible for
all transmissions by either station. The other case to consider is automated

forwarding of messages. In this case there are two stations involved,
and it is quite clear that each bears responsibility for what it transmits.

What some (well, a few) of us asked for was common carrier protection.
What this means is that the owner and any control operators of a BBS
system would only be responsible for content they themselves personally
originated. Any content relayed for third parties would not provide any
risk to the owner or any control operators. The reason we asked for this
protection was to encourage the growth of store and forward networking.

Note that the "first relay station joint liability" also applies to nodes.
If you own a node, and someone connects through it and does some "bad
things", and your node was the FIRST node to transmit those "bad things"
you are liable for them. Better get a quick shutdown remote switch on
those nodes ... just in case ... <smile>. This effect of the rules was
in fact noted at the meeting, by myself and others, but the concensus
was that such liability could not reasonably be placed on node owners
due to the rapidity of data movement through the network. Now that we
have even faster networks, the same argument should apply to BBS systems.

Note that network nodes "store and forward" data just as BBS systems do.

Enough babble ...

> If he had nothing to hide, he'd have no problem making a statement to that
> effect, would he?

Seems reasonable to me.
I've tried to make my position clear (give us common carrier protection).
Perhaps Greg will also.

An amazing fact that not all of us may have been aware of is that gateways CAN be utilized for puposes other than circumventing and avoiding the use of Radio by Ham Radio operators.

Those who have damaged the existing Ham Digital Net with "Amateur Telephone" are indeed LandLine Lids, but the fault lies with the operator's misuse of the gateway, not the gateway itself.

I am accused of being "anti-gateway" by LandLine Lids quite often. The APRS folks and others who have found more legitimate use for gateways seem to be a lot less likely to suffer from that delusion. - Possibly because I have invariably praised and encouraged their efforts.

Hey! I resemble that remark, Buddy!

How about "half-assed"? I looked in a rather large dictionary - It wasn't
there...

Not that I really care, one way or another. As a Texan, you can always
assume that I am speaking "Texican" and not the language common to the
"New-knighted states of America". The Repulic of Texas is pretty much a law
unto itself. Come visit and see fer yourself!

Don't forget the various chat gateways. Same deal: they are not in any
way bypassing a service that is provided or (at this time) could be
provided via ham radio links alone. No problem with those either. They
can be a lot of fun. It's those Land Line Lids bypassing message store
and forward systems that already use (or could easily use) ham radio to
get their work done. Those are the folks we need to shut down. They do
great harm to the network, as has been documented often by many people.

No, I'm not going to do anyone's homework and look up those messages
and posting for them. Anyone who is really interested can do the work
themselves. If anyone wants my log files (spanning early 1984 to the
present) they are available. Notice I didn't say "for free" ... you
would have to provide the tape, mailer, return postage. Already spent
enough of my own money on things like that.

3997. Digital Modes

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-25 00:00:00 UTC
From: Steve Sampson <ssampson@access.usa-site.net>
Message-ID: <FjMO1.160$fl2.2254636@news.goodnet.com>
Source record: 22289

I'm curious. There is some discussion about digital modes and their
being interfaced to non RF links (modems, fiber, etc).

What is the purpose of these digital modes? What is the real
end-game for the design of any of these linked systems? Is the
end-game possibly emergency communications? or, is it
just an end in itself?

I guess I don't understand the purpose, thus I don't understand
the polarized views.

I can understand that Ham radio is limited in what kind of data
is legal to transport. But I don't think any Ham really wants to
use the hobby to duplicate what is available elsewhere.

I've viewed the message content of the various Ham digital
systems, and it is basically noise. This must be test or
filler data for the real purpose. What is the real purpose?
I've looked in all the ARRL manuals and books, and I can't
find anything that tells me the end-game purpose of all
this expensive equipment. What does Ham radio digital
modes mean to you, when we know it must cost at
least a few hundred dollars to set up, and use.

I understand, that there are emotional and political
limitations concerning particular data or modes, but
what is the end-game if, suppose, everyone agreed
on one mode and one rule?

Steve

Steve, this is a hobby. We do it because it is fun. We do not have
to justify what we do in any way to anyone. The side effect is that,
were we to all cooperate and build a single network, we would have
the emergency communications ability. Ham radio is ALWAYS about
emergency communications. Read the history, read Part 97.
In particular read the WW-II history.

> I guess I don't understand the purpose, thus I don't understand

> use the hobby to duplicate what is available elsewhere.

Steve, this is where you miss the boat. It is exactly the duplication
of "what is available elsewhere" which makes ham radio useful in
emergency situations. The ability to use, for example, 2M point to
point voice when the power and telephone is not working, the ability
to move a little bit of digital data when ALL other means of moving
(for example) supply requests and situation reports. This is what ham
radio can do. Recent example: grass fires near Pendleton, Oregon took
out the National Weather Service communications links. Burned them to
the ground: buildings, telephone lines, transmitters, antennas, feedlines.
Hams set up temporary links using 2M and 70cm. The NWS was able to get
their detail forecasts to the place they were needed via that network.
The reason the forecasts were important? Expected wind speed and direction,
temperatures, etc. The information needed by the firefighters to get
their job done and remain alive. Sure you say, but didn't cell phones
work? Yes, they worked. In fact the initial response, before the hams
were called in to help involved someone with a cell phone getting the
data by voice and writing it down. Error prone. Slow.

> I've viewed the message content of the various Ham digital
> systems, and it is basically noise. This must be test or
> filler data for the real purpose. What is the real purpose?

To provide traffic over the network so the network is continuously
tested and thus WILL be available when needed for "important" use.

> I've looked in all the ARRL manuals and books, and I can't
> find anything that tells me the end-game purpose of all
> this expensive equipment. What does Ham radio digital
> modes mean to you, when we know it must cost at

The ARRL is almost clueless in this respect. Look elsewhere.

> I understand, that there are emotional and political
> limitations concerning particular data or modes, but
> what is the end-game if, suppose, everyone agreed
> on one mode and one rule?

Um ... to play with our radios!
This is ALWAYS the answer Steve.
Heck, try it out ... it's fun.
Discovered yesterday that one of my neighbors has 100 feet of what looks
like Rohn 25 sitting in one of his outbuildings. He does not have a use
for it. Appears 50 feet was used to support a barn light. He wants to sell
it. I'm looking at my upper pasture and thinking "Hmmm ... if I got up
100 feet from this site, I could probably see Horse Rock and some of the
hills south of Roseburg. We only have one good link that way. A second
9600 or faster link would be very useful during the next ice storm."
"Hey! I could mount a 10M 8 el fixed yagi pointed east on that tower."

Just the usual ham thinking. "If it's metal it's an antenna or antenna
support. Use it."

Why bother to reply? Non-hams do not have the experience and knowledge
to understand the answer to this question. Hams will understand it
of course, since it is part of the environment in which we operate.
To explain all this to a non-ham would take many pages <smile>.

(I assume "qwasty" is not a ham. If he were a ham he would display his
callsign in his postings.)

I have a TS-450 and SGC-230 Tuner on my sailboat. I am considering
purchasing a SCS PTC-II to add to this configuration to do email
via Pactor-II.

Does anyone have experience with this or similiar configurations.

Does it work or is there some feature with the TS-450 that makes this
a less then optimal system ?

Does it help to have any of the optional filters for the Kenwood installed
to run Pactor-II ?

Is it possible to connect the PTC-II and the Kenwood without using the
microphone plug ?

Thanks

Marc

Hmm..that is true that the amateur service HAS had a high standard for the station operator's responsibility to censor the use of his equipment, at least from what I've read (I'm 18 years old so I wasn't actually "there"). BUT how long have amateurs been operating automatic equipment on the air? I doubt that this practice would be as old as the "rules". When technology changes, the rules have to bend to accomodate the technology, not the other way around.

Countries that do it the other way around: Iran, Iraq, Syria, India, Libya, Cuba, are you noticing a trend yet, China, Saudi Arabia, Pakistan, etc, etc. These are countries that embrace outdated ideas. The US has a history of NOT doing this, as does one of it's agencies, the FCC.

There is no way we can progress as amateurs if we hold to "rules" that really have no value beyond keeping things running smoothly. Why shouldn't we toss outdated rules and regs? is there an emotional attachment? I am sorry charles, I try to listen to both sides of an argument objectively but I can't see the logic in your arguments. Granted, I prolly haven't been around as long as you have, so if I'm missing something let me know.

Although most of my LabView experience has been using the GPIB bus, I believe the serial port interface should be fairly straightforward. I presently can't justify or afford getting LabView for home use just to control a radio, but if you have it, use it. You might also want to ask this question on comp.lang.labview.

>Harvey, WB5MCT

Nice idea. Let me know more details. Is it enough to start FBB under BPQ interface and Baycom driver for BPQ on the server, and Baycom program on the client? Will all that work automatically, or it is needed to make some special configuration as like as that works via radio? Is that cable something like a null-modem cable I have heard about? Is it possible to use LPT instead of COM port? What in case of using Flexnet instead of BPQ, because I was told that Flexnet is much better than BPQ?

Marc,

I have not used the PTC-II with the TS-450, but with the TS-430 and it worked just fine. I currently run it with my Icom 746 and I have found the 500 Hz filter a *great* improvement over the standard SSB filter. Essentially, it works according to theory; i.e. when you limit bandwidth, you improve the S/N ratio. Pactor-2 goes works really well that way.

I have been using the SCS PTC-II for about 18 months it's a great piece of equipment and well worth the investment. I'd suggest getting a 500hz filter for your rig. You can wire up the SCS to the back of the TS450S.
There are a number of stations running WinLink/NetLink software for Mailbox service - NetLink provides the necessary interface between the radio side and the internet. If you want more information send me a note and I'll be glad to send you the frequencies/times of the active WinLink stations. Also HTTP to winlink.org and pick up the airmail software - you must be running win95 or better to use this software. I do not use it but there are users on my system that do and they are delighted with it.
Regards
Pat, N0ZO

Hi Roger,
Have you tried http://www.kantronics.com/products/htm ???
This page lists all the different versions and what was upgraded.
The later upgrades added Pactor, GTOR, and APRS features and if you use
these modes then I would say it's worth upgrading.

I have an old KAM that's been upgraded to V7.0 and I just love it.

Hope this helps.

Richard,

Many thanks for the info, I would certainly be interested in the GTOR
facility, I'll take another look at the Web site.

Bye,

Roger, G3VKM

4022. Why use or experiment with digital modes ?? an answer:

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-26 00:00:00 UTC
From: Patricia Gibbons <wa6ube@ix.netcom.com>
Message-ID: <360D3BCD.4807@ix.netcom.com>
Source record: 22312

-----BEGIN PGP SIGNED MESSAGE-----

The use of the newer HF digital modes allows, at least for me, and our City of San Jose Office of Emergency Services, the ability to pass written traffic over poor or degraded HF radio paths with no errors.

Our City Emergency Operations Center (EOC) has a Gtor mailbox on the air for testing purposes, and also the State of California Office of Emergency Services is exploring the use of GTOR and Gtor mailboxes on their HF network that consists of 10 channels in the fixed service between 2.4 and 7.9 MHz. The State system also employs the Automatic Link Establishment (ALE) protocol and Gtor will be running on top of the ALE layer. Not that many amateur radio operators are familiar with, or use ALE, but it is another example of the complex evolution of electronic communications techniques.

The purpose of both Commercial and Amateur experimentation in the area of Communications is to extend the state of the art. The end result is more consistant and reliable communications capability, especially on noisy or degraded HF paths without the need of more and more operator skills to make it work correctly.

ALE removes the need for HF propagation prediction programs, and the need for an experienced operator to be able to know which HF channel in the RF spectrum would be the "best" frequency for two specific stations to communicate. ALE allows the radio equipment to keep track of band conditions and channel quality through automated "sounding" and "link quality analysis" (LQA). These enhancements, in addition to selective call for individual net members or group-wide net-calls result in more efficient use of HF spectrum and the ability to "get the message through" when it really matters.

Developments such as these would not happen without individual interest in such matters, and both the Communications Engineer or Radio hobbyist who is willing to explore, synergize, and try something new that may prove to be an advancement over communications methods we have now.

This reminds me of Alexander Graham Bell, when he wanted to introduce the telephone in England was met with great resistance to the idea. Many businessmen were startled at the idea of the telephone. The famous quote was:

"Why do we need the telephone when we have a plethora
of messenger boys?? "

Currently there is great commercial interest in a direct
HF radio interface to the internet. This is especially
desireable in areas of the world that do not have a
reliable infrastructure of land-line telephone service
such as exists in the more advanced areas of the world.

Imagine being out at sea in a ship and being able to
access the internet simply via an HF channel and not
being dependant on the expensive infrastructure of
Satellite phones, or even the newly deployed
Iridium System being put on the air by /\/\otorola??

Trish <wa6ube@ix.netcom.com> or
<patricia.gibbons@ci.sj.ca.us>

Remember that you must run the rig in SSB mode in order to use Pactor II. This means that you must be able to select the 500 Hz filter while in the SSB mode in order for it to be usable. Many rigs can't do this - perhaps the TS-450S can. Make sure before you spend the money on the filter.

If you want to upgrade a Kam to the latest, the KAM-E, you'll need to
purchase an Eprom (version 8.2) and a daughterboard for the KAM.

You can email Kantronics at sales@kantronics.com for pricing info.

4026. Call for beta participants

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-26 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <en3K4mc69GA.316@upnetnews05>
Source record: 22316

Creative Services Software,Inc. is looking for beta participants for the following products:

HF Email '98: A Windows 32 bit AMTOR/PACTOR Eudora-like front end for HF Internet Email, support for WLO, Globe Wireless and Winlink. Requirements, Kantronics KAM, KAM Plus or Kan 98. (Timewave and MFJ versions supported in future releases)

WeFax '98: A Windows 32 bit Wefax program, Requirements, Kantronics TNC that supports the WeFax command. (Timewave and MFJ versions supported in future releases)

PacTerm '98 version 1.5: The next update of PacTerm '98, host mode program for Kantronics TNC's.

PacTerm /CE: A Windows CE host mode front end for Kantronics TNC's (support for Timewave and MFJ TNC's supported in future versions) Requires Windows CE 1.0/2.0 palmtop PC.

PK-Term '98: a Windows 32 bit host mode front end for the Timewave TNC line. Requires AEA/TImewave TNC (all supported from PK-87 to DSP-2232).

Multi-Term '98: a Windows 32 bit host mode front end for the MFJ-1278 TNC line.

Paging Server 2000: A Windows NT paging server for use with POSAG and TNPP paging. Works with Kantronics 9612p or Kantronics Paging Controler 2000.

For participating in the beta, you'll receive a free copy of the program when finished.

What we need from you:

Name
Callsign
Address
Phone number
Product(s) you wish to beta
Time you can spend per week on testing
Previous beta experience (other products with other companies)
Current computer configuration

Please email this info betareq@cssincorp.com. Beta participation is limited.

Best regards,

The CSS beta team.

>Thanks.

That's not quite true. The first distress prosign coincided with
the general call: CQ. At the Berlin Conference of 1903 the need for
a distinct distress call was recognized, but one was not chosen.
The British Marconi Company ordered its ships and shore stations
to use CQD. Since Marconi has a strangle-hold on the state of wireless
communications, that call became the unofficial norm. At the 1906
international conference (again in Berlin) the delegates again discussed
the need for an international attention-getting distress call. The German
delegation suggested their SOE be used, but other delegates thought the
"E" could easily be lost in a crash of noise. After much debate, it
was agreed upon that ___
SOS
sent as the single character ..._____... with no spaces (that's what the
bar over the letters is supposed to indicate) should be the international
distress signal for code. At later conferences, a strict set of procedures
were created in regards to distress communications (including the Auto
Alarm signal of twelve 4-second dashes with 1-second spaces which would
activate bells and lights aboard any ship whose radio receiver copied it).

The QRR you refer to is an amateur-created signal from 1925; it was
used to indicate that there was a railroad emergency and all amateurs
should stand by to assist in handling railroad message traffic.

___
Today, SOS is the only Morse distress signal, on or off the ham bands.
Signals of lessor precidence include:
XXX XXX XXX DE ... to indicate one has an Urgent message to pass;
TTT TTT TTT DE ... to indicate one has a Safety message to pass;
CQ CQ CQ DE ... as our General Call.

How these signal were used in practice can be seen in the following
U.S. Coast Guard radio log for a one-hour period on 500 kHz (the
international calling/distress CW frequency).

Jeff KH2PZ

Copyright 1994 by Jeffrey Herman - All Rights Reserved.
In order to preserve the history of 500 kc permission is

granted for wide distribution of this series as long as no
monetary gain is to be made. Please notify me in advance.

500kc - Part 7: A Typical Night

This part differs from the previous in that what follows will be
an actual log of signals copied during a typical one hour. During
our training at Coast Guard Radioman School (Petaluma, CA) we
were advised to attempt to log *everything* we heard. Well, that
was an impossible task due to the volume of calls passing over
the seas nightly! (Keep in mind that only short calls were
permitted on 500 - as soon as contact was made one was to quickly
move to a working frequency). What you'll see in the following log
consists of only about 10-25% of the signals transmitted.

The log consisted of 3 columns: The actual signals copied,
the frequency, and the time. A slash: / was used to indicate a break
between two transmissions, *except* when it was actually sent over the
air to indicate two frequencies - you'll see ``454/440'' meaning ``you
send on 454 kc and I'll send on 440 kc'' (the -..-. is actually
sent). Ships had a choice of using 425, 454, 468, or 480 kc as
their working frequencies, while shore stations were only assigned one
working freq, usually near one of the above, so in order to
work duplex one of the above, which was closest to the shore's
freq, would be used by a ship.

Everything you see will be actual transmissions except:
1. When preceeded by OPNOTE (= operator's note)
2. The BEGIN or END SILENT PERIOD entry.
3. The NO SIGS entry (meaning no signals heard in last 5 min.)

Notice the generous use of `dit dit' (and us hams probably
thought *we* invented it!). In the log it is indicated by `EE'.

END SILENT PERIOD 500 0918Z

What you see above is a typical one hour period of evening Pacific
signals transcribed with, again, at most 25% of the transmissions logged.

You noticed the exchanges were short (with operators quickly moving
off 500 kHz to a working frequency) and informal with generous
use of pleasantries such as TU = thank you, TKS = thanks, SU = SEEU =
see you, OM = old man, GE = good evening and of course the ever present
`dit dit'.

Note the prosign VA is the ham's SK.

The 0900 entry was typical for the top of the hour - a dozen
CQ's being sent at once!

The idea of 500 kHz being an international calling *and* distress frequency
was finalized at the 1932 Madrid Radio Conference (see Schroeder 1964).
I find it a shame that amateurs never implemented the idea of a calling
frequency on each band which everyone would monitor, in which short
station-to-station calls and CQs could be made, with parties moving
to another frequency for the QSO. Two-meter repeaters come close to
this idea but operators fail to QSY off the repeater to try to work
simplex. Oh well - something about Old Dogs, New Tricks...

Anyone have an use for some old A & A Engineering equipment?

I have a "Poor Mans Spectrum Analyzer" and a Digital VFO.
The SA is used with an O'Scope and is good to 450 MHz.
The VFO will go to 6.5 MHz, and is quite good at aligning
things. $100 for both. Uniden has no mods, but needs to
be aligned. It's been in the closet since 1990 or so :-)
Probably make a good beacon... (no Microphone).

All this stuff works, sold as-is, I pay shipping, no return, no
refund, so there...

From: jgoebel@my-dejanews.com
Message-ID: <6uoeal$kn0$1@nnrp1.dejanews.com>
Source record: 22326

I am interested in gatewaying HF APRS to VHF for the benifit of local hams. Currently, I use a PK-232MBX(v.7) on HF and KPC-9612(v.7) on VHF at 1200 baud. Is there anyway to gateway using these? Any APRS software that can do this?

I have found info that indicates how to gateway using a dual port KAM or DSP-2232, but wanted to avoid purchasing more equipment if possible.

I have only been trying APRS out a few weeks so am new to this.

Tnx,
Jeff Goebel N0VHB

4037. Need help with TCP/IP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-09-28 00:00:00 UTC
From: Ernest Stracener <ih@execpc.com>
Message-ID: <360FAF81.8D5C410E@execpc.com>
Source record: 22327

I'm new to packet radio and happen to live in an area that does not have much to offer in the way of BBSs but there seems to be a LOT (many, many) TCP/IP nodes that I could hit...but I don't know what to do with them! I've tried to read what I can find on the internet about it, and it appears that one basically has to have an extra computer running a home-brewed OS called JNOS in order to utilize TCP/IP via packet. Is this correct?

Is there a way to utilize TCP/IP under Windows 95 in a window?

What can be done with TCP/IP & how?

Any information or pointers to information resources would be greatly appreciated, as would emailing a copy of your reply directly to me.

Thanks for your help.

73-
Ernest, KG9NI

Source record: 22328

Hi Ernest

Check out the web site of SV2AGW for TCP/IP under win95. He has a new
setup for win98 as well.

http://www.forthnet.gr/sv2agw/start.htm

Also check out the Flexnet site at

http://dl0td.afthd.tu-darmstadt.de/~flexnet/

This can also use the win95 IP stack but is a bit convuluted :-((

As to what to do - that depends on your local 'hub' stations. Over here we
run www, dns, ftp, gopher, IRC (gatewayed to convers), nntp (with ax25 gateway),
smtp, pop, MUD (Multi User Dungeon), webcams - just developing into APRS,
indexed newsgroup archives under www. You name it and we'll try and make
the bandwidth for it... (eg. samba disk shares over radio, NFS)

Cheers

>BPQ node?

How about WinPack using PC Flexnet, or WinPack using SV2AGW's packet
engine (AGWPE)? If you've got Win95, AGWPE is well worth looking at,
because it loads from within Windows and so you can easily unload it
when you're not using it.

Or (to show I'm not biased ;-) you could try G7JJF's WinTNC.

4056. FT-847 and packet operation

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-01 00:00:00 UTC
From: Dana@Source.Net
Message-ID: <6v0vce$u5k$1@nnrp1.dejanews.com>
Source record: 22246

If you're interested in using an FT-847 for packet, you ought to have a look at http://www2.source.net/dana/ft847_pkt.html.

In particular, I explain how easy it was to build the packet cable using a common PS/2 keyboard extension cable, and I also reveal the discovery that excessive transmit data amplitude will inhibit transmitting at all.

Enjoy, and send me any (reasonable) feedback you have.

4062. List of the rec.radio newsgroups

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-02 00:00:00 UTC
From: jeffreyh@Hawaii.Edu
Message-ID: <6v1m3a$4tr@news.Hawaii.Edu>
Source record: 22252
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx

```
Archive-name: radio/personal-brief-introduction

In an effort help ensure a poster's article reaches the appropriate
audience, below is a list of the rec.radio newsgroups. In most cases,
a group's name will explain its purpose. Cross-posting should rarely
be necessary.

rec.radio.broadcasting (devoted to the broadcast industry; moderated)
rec.radio.cb
rec.radio.info (periodic informational bulletins; moderated)
rec.radio.scanner
rec.radio.shortwave
rec.radio.swap (for buying, selling, and trading; not a discussion group)

rec.radio.amateur.antenna
rec.radio.amateur.boatanchors (tube-type communications equipment)
rec.radio.amateur.digital.misc (packet, pactor and other digital modes)
rec.radio.amateur.dx (long-distance amateur communications)
rec.radio.amateur.equipment (questions, comments regarding commercially-
built amateur gear; not for buying/selling)
rec.radio.amateur.homebrew (devoted to home-building ham gear)
rec.radio.amateur.policy (issues include code, restructuring, local
restrictions in conflict with FCC R&R)
rec.radio.amateur.space (satellites, meteor scatter, EME)
rec.radio.amateur.misc (any topic not covered in the above groups)

(At least two other English language radio hierarchies exist, prefixed
with "uk" (United Kingdom), and "aus" (Australia), in place of "rec.")

Again, cross-posting should rarely be necessary. Many times, a long-
running thread results from a single cross-posted article, and the
contents of such a thread drift further and further away from being
"on-topic" in the various NGs that receive each and every followup.

For more detailed information, see "Guide to the Rec.radio Newsgroups"
posted on the 15th of each month.

From: Ian Wade <ian@dowrmain.demon.co.uk>
Message-ID: <TMV4jKA$xHF2Ewa1@dowrmain.demon.co.uk>
Source record: 22254

Thinking of buying a KPC-3 Plus for APRS. What is the current version number of its ROM? 8.3 is the latest I've heard of.

Also, Kantronics' web site says the manual costs $19.95. Is this included with the TNC, or do I have to buy it separately?

4069. Can None QSK Linear Amp Do Digital Modes?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-02 00:00:00 UTC
From: davidho@one.net.REMOVE
Message-ID: <361527b0.5753943@news.netnews.att.com>
Source record: 22259

Just wonder if anyone can tell me whether I can use a
linear amp to do PACTOR, AMTOR, GTOR, and Packet
on HF. I think that it's obvious that RTTY should be OK
for most amps, as long as the cooling is sufficient.

I am thinking about getting a 600 - 800 watt class amp.
However, I don't recall seeing any ad that says the amp
will support the modes that are mentioned above.

Can QSK option be helpful for the T/R switch demands
called for by these modes?

If you have any experience, would you please share?

Thanks in advance.

hi Jeff..

name here is richard, ke7xo.. running a gate here in Las Vegas.. I'm using an old 486 computer with 4 comm ports and a program called BPQ and Stealth Digi.. between the two you can do almost anything..

I know the KAM will run in KISS mode, and believe the AEA will too (you run your tnc's in KISS) with BPQ

let me know if you want to try it out...

oh.. my call on hf is ke7xo-2... you can connect to my APRS program callsign of ke7xo-3..

Obviously we won't be seeing a WebCam feed from conrad anytime soon.
He's too busy munching on popcorn to make such an effort, let alone
attain 13 or 20 WPM and a higher-class license. If his post is a
reflection of his mentality, I'd rather spend my time at a WebCam site
than attempt an intelligent QSO with him. Flame away, rad.
Enjoy your popcorn.

AMTOR has the most critical timing. You will need a
QSK amp to run AMTOR. PACTOR and packet should
work with most amps.

>knowing morse?

The ITU distress format includes a 10-second key-down for RDF purposes.
In this instance, one could close the key switch to key the transmitter
continuously.

I might as well provide the entire ITU format for you:

Transmit Auto-Alarm signal (twelve four-second dashes with one-second
pause between dashes) - this causes alarm bells to begin ringing in
other stations within receiving range

Wait two minutes (if possible) for off-duty radiomen to respond to
their radio room in answer to the ringing bells

Send the distess message:
SOS SOS SOS DE <callsign> <distress message> BT SIGNED MASTER AR SOS

Transmit continuous carrier for ten-seconds for RDF purposes

Acknowledging stations send:
SOS <callsign of distressed station> DE <own callsign> RRR SOS

From now on, all transmissions from all responding stations
must begin with SOS. The frequency is now in an extended
silent period until QUM is sent by the controlling station

Oh, what the heck - I might as well append a story of an actual
distress I worked many years back; here's Part 6 of my 500 kc
series - hope you all enjoy reading it! (You might feel as if
you started in the middle of some book - you are - there were
five previous chapters prior to this one.)

Jeff KH2PZ

Copyright 1994 by Jeffrey Herman - All Rights Reserved.
Permission is given to publish this piece as long as no monetary
gain is to be made. Please notify me prior to publishing.

In the following true narrative the ship's name and her callsign
have been changed.

Part 6: My First SOS at NMO

As mentioned in an earlier part I always sat the 12 hour 500 kc
night watch on my duty nights; I loved listening to the steady
flow of calls from ships in far off waters. Even though we sat
in the Central Pacific I would sometimes even copy a fluttery East
Coast US shore station. Throughout the night I would hear ghostly
signals, just above the noise level, that would fade in and out from
who knows where. We used a Beverage-type long wire that stretched over
one mile in length, and NMO sat in a very electrically quiet region.
We were able to copy any ship or shore station anywhere in the Pacific.

One evening, feeling a bit drowsy (0200 local!), I thought I was dreaming
when I heard a long dash, a pause, another long dash, a pause, another
long dash, a pause, ...
Like an electric shock, adrenalin flooded through me at
the speed of light - OH MY GOD - SOMEONE IS SENDING AN AUTO ALARM!
My eyes shot to the clock to time the dashes: 4 seconds on, 1 second
off, 4 seconds on, 1 second off - those 12 long dashes almost froze me.
I yelled into the intercom to the chief `Auto Alarm on 500' knowing
at the same time alarm bells were ringing on board every ship scattered
around the Pacific within radio range of the distressed ship. Recall
that when a shipboard operator goes off watch, ITU rules dictate he leaves
a receiver tuned to 500 kc with a decoder attached - if that decoder hears
at least four 4-second dashes each with 1-second seperation, relays in
the decoder will clamp shut triggering alarm bells in the radio room,
in the radio officer's sleeping quarters, and up on the bridge, to warn of
a distress message about to be sent on 500 kc. Now, the two-tone AA
used on the voice SSB MF distress/calling freq of 2182 kc was common:
Mexican fishing crews used them when they were drunk. But AA's on 500 kc
are *never* sent except when a ship is in distress. This was the first
one I'd heard since my radioman school days; I can't put into words
the terror I felt while sitting out the ITU-required 2 minute wait
(recall that the ITU dictates every step the distressed vessel's radio
officer takes: Auto Alarm, then the 2-minute wait [if possible] for off-
duty ops on other ships, woken by their Auto Alarm receivers, to race
to their radio shacks to copy the distress). 500 kc was now in an
extended silent period (see part 2 or 3 [or 4?]). Someone started
tuning up and was immediately pounced on by myself: QRT SOS was all
I needed to send - dead silence. One of the Australian shore stations
was sending a CQ at the same time the AA went out - he must have heard
the AA through his CQ for he stopped in mid broadcast. Nothing but
an occasional static crash - dead silence. Throughout my brief 500kc
career there had never been a silence like this I thought. Then it came:

SOS SOS SOS CQ DE DJNK DJNK DJNK SOS BT MV PANAMA TRADER HULL CRACKED IN
HEAVY SEAS MAJOR FLOODING 42-27N 42-27N 178-51W 178-51W NOW ABANDONING
SHIP SOS BT MASTER AR K

Then came the 10 second-long dash (ITU: for direction finding).

I was first - in A2 I sent:

SOS DJNK DJND DJNK DE NMO NMO NMO RRR SOS

and after me 500 kc was flooded with ships and shore stations sending
sending the ITU response of RRR SOS:

SOS DJNK DJNK DJNK DE NMC NMC NMC RRR SOS (San Francisco)
SOS DJNK DJNK DJNK DE NOJ NOJ NOJ RRR SOS (Alaska)
SOS DJNK DJNK DJNK DE NMQ NMQ NMQ RRR SOS (Long Beach, CA)
SOS DJNK DJNK DJNK DE KPH KPH KPH RRR SOS (San Fran.)

<ITU dictates a strict format to follow in distresses - from now on
every transmission must be proceeded with the SOS prosign>

along with KFS in California, NRV in Guam, a couple Japan shore
stations; the radio operator aboard DJNK must have breathed a sigh
of relief and taken some comfort knowing his message was heard by so
many.

Once the RRR SOS replies ceased NMO took control; I asked the
standard questions for situations such as this:

SOS DJNK DE NMO BT NEED FOLLOWING INFO
NR OF POB (number of persons on board)
CSE (course)
HULL ES SS COLOR (hull and superstructure colors)
NR OF BOATS (number of lifeboats)
BOAT RADIO FREQS, EPIRB
WX, WIND SPD ES DIR, SWELL HT ES DIRECTION, CURRENT (weather and sea data)
BT SOS K

and DJNK patiently answered each.

After getting these important answers I had the uncomfortable
task of asking:

SOS DJNK DE NMO BT OM PSE CL KEY BEFORE U LV OK? K

SOS NMO DE DJNK WILL DO OM

Every shipboard telegraph key has a switch which, when closed,
will continuously cause the ship's radio to transmit. This enables
rescue aircraft to home in on the distressed vessel using their
direction finding equipment. I had asked the op to close his key
switch before he leaves the ship.

At the same time our AMVER computer was generating a printout of the
locations of ships transiting the North Pacific: No ships were in DJNK's
area! At least no AMVER reporting ships; it's possible there was a ship
close to DJNK that wasn't sending us his AMVER position reports. A
very slim possibility but a chance we couldn't ignore. I was ordered
by our Rescue Center to send the DDD SOS, i.e. to relay DJNK's distress
message from our 10 kW transmitter. In A2 I sent:

AUTO ALARM (12 four-second dashes with one-second pauses)

then with my hand shaking, clenching the key:

DDD SOS SOS SOS DDD CQ DE NMO NMO NMO SOS BT <DJNK's message>
BT ANY SHIPS IN AREA DIVERT AND ASSIST SIGNED US COAST GUARD
AR DDD SOS K

Dead silence reigned for minutes which seemed like hours. An
awful, awful feeling of helplessness overcame me as I sat in
that chair with the entire NMO crew standing in silence - all of
us knowing at that very moment men were perishing in an icy ocean...

Already we had aircraft in the air heading to DJNK's position
so I notified him:

SOS DJNK DJNK DE NMO NMO BT USCG AIRCRAFT LAUNCHED TO UR POSN
ETA 3 HRS BT HOWS UR COND? K

SOS NMO DE DJNK HV TO LEAVE SHIP NOW TU OM FER <high pitched whine>

His transmitter had emitted a - a scream - it actually screamed!
I turned to the Chief asking ``Is that...?'' ``Yes, the ocean water
just flooded his radio room shorting out his transmitter and
batteries.''

I couldn't accept this - the man at that key couldn't have just
perished! I sent:

SOS DJNK DE NMO
<silence>
SOS DJNK DJNK DE NMO
<silence>

At this point the Chief put his hand on my shoulder and only said
``He can't answer you - he's gone.''

Throughout the night I continued to send the Auto Alarm and the DDD SOS to
no avail. At daybreak our aircraft reported seeing only debris: bales of
hay, which was the cargo of DJNK; no lifeboats, no bodies, only debris.

Even to this day I sometimes hear, in my sleep, the scream DJNK's
transmitter emitted that terrifying and horrible night. I pray
the crew of that ship rest in peace.

End of Part 6.

I like WinPack and have used it almost since it's inception. However
I haven't had much time to delve into it recently - just use it! Do I
take from your comment Roger that with SV2AGW's engine I can still
carry on automagically connecting to my local BBS on VHF and grabbing
bulls/mail and also have an HF port that my brother (G4DIW/SO5DIW) can
connect and leave me mail in WinPack? At present he logs into the
PK-232 and leaves messages in it's internal mailbox and I access that
via XPWIN. Although XPWIN handles multiple TNCs (and modes) it
doesn't handle grabbing bulletins from my local BBS.

I haven't seen the post you are replying to, so I don't know
what set the tone for the question, but it is a valid
question. I was wondering myself. Asking a question is not
a sign of hostility.

You are not asking to buy anything so it could not have been
WTB, so I did not see it as a mistake, just an acronym that
I am unfamiliar with.

It also seems to me you have gotten a couple of helpful replies
from hams. Many nasty arguments are started by someone taking
offence where no offence was intended.

If you have further questions that were not answered at the
sights suggested, ask. If I don't know, and I probably don't
somebody will. Or if not, then maybe we can learn together.

To speed things up a bit, have the controller key the transmitter and the amp if possible instead of having the controller key the transmitter then the transmitter key the amp. Might also want to add a few ms of TXD. I use my old Henry on Pactor but have not tried it with Amtor.

I got my licence in 1962. Have been active for 3 years and then the kids, the job, the travels forced me to stop.I retired early with one objective in mind...get beack my license and experiment again with what can be experimented in today technology by a simple technician. I then restarted two years ago focusing on antennas. Now I believe I understand 10-20% of them but anytime i make a QSO and talk about my experiments, tests,achievements and disappointements and I exchange my technical views, I get a lot of attention and many OM's express their satisfaction in hearing QSO's talking about technical experimentation against the many QSO's just talking about the weather.....
Our hobby should get back to its initial objectives and this will by sure attract lot of yungsters.

All the best Anselmo, HB9ICK- IZ3BGJ

Folks,

Just yesterday I ran into one of those things that give newcomers the impression that HAM radio operators can be elitist and exclusionary -- I was on the 14,247 kHz DX net on 20m, going through the rotation as usual when I got really slammed by one of the net control guys -- just for giving the DX station my name and QTH! It wasn't as if I was conducting an extended rag-chew QSO either -- The whole thing was over in less than 30 seconds. Apparently, it is only acceptable to give call signs, signal reports and 73's to DX stations on the DX net. Nevertheless, the language and tone in the rebuke was so completely out of proportion and uncalled for that I won't repeat it here. I have only been back in amateur radio for a month (after a 25 year hiatus), and it really gave me a cold feeling to think that other people just getting into HF might get this kind of treatment as well. People have to remember that lives don't depend upon the procedures used to work DX... We should be working towards maximizing the cooperation and pleasure of all amateur operators, or else we're all going to lose out. If I hadn't known that this was something of an aberration, I would have developed a bitter feeling about ham radio in general and HF in particular. As it was, it soured the experience for the rest of the day. I realize that nerves were a little ragged due to the QRM problems stemming from the California QSO Party, but that doesn't excuse rude behavior that is detrimental to the hobby as a whole.

>

Gary, while it is probably possible to improve the response time of most amps, note for example the MFJ QSK kits and the like, and the details on getting the Heathkit amps ready for CW qsk, it still leaves open the question of how long most amps can be operated in the equivalent of keydown operation before some component or other dying a hasty unexpected death.

I also note that most rigs have manuals which insist that the output be turned down during rtty, amtor and the like just to save the finals, and if you have to run the rig at something like full output, you won't have rig with working finals soon either. I suppose a rig that puts out 30 watts when it's nominally rated at 100 won't have many problems, and an amp designed to be fed with 70 watts that will accept 30 watts also won't die, but that is one of those details that should be researched before beginning to use most of the digital modes.

Mike, there was a command you had to type into the computer to get the
PK64 to run, I've forgotten what it was, but think it was a standard
statement,
or command if you will. Sorry I can't be of more help

Yeah but joining a 'LIST' to get to work a DX station through an intermediary
self-styled "RADIO GOD" like that is no fun anyway.

How BADLY do you want to work a new country?
If it means licking that bastards jack boots, I don't NEED to work the stinking
DX! I would rather wait and take my chances to work the DX the REAL way.

Some of those "DX NETS" with a control operator, sound as phoney as the County
Hunter QSOs where each station imagines they gat an RS "2-2" report from the
other guy and the relay station confirms it as a good QSO where in actual fact
they can't even hear each other at all!

HELLO? "SEVENS COME NOW - BEGINNING WITH ALPHA ONLY!!"

br Folks,
br Just yesterday I ran into one of those things that give newcomers
br the impression that HAM radio operators can be elitist and
br exclusionary -- I was on the 14,247 kHz DX net on 20m, going
br through the rotation as usual when I got really slammed by one of
br the net control guys -- just for giving the DX station my name and
br QTH! It wasn't as if I was conducting an extended rag-chew QSO
br either -- The whole thing was over in less than 30 seconds.
br Apparently, it is only acceptable to give call signs, signal
br reports and 73's to DX stations on the DX net. Nevertheless, the
br language and tone in the rebuke was so completely out of proportion
br and uncalled for that I won't repeat it here. I have only been
br back in amateur radio for a month (after a 25 year hiatus), and it
br really gave me a cold feeling to think that other people just
br getting into HF might get this kind of treatment as well. People
br have to remember that lives don't depend upon the procedures used
br to work DX... We should be working towards maximizing the
br cooperation and pleasure of all amateur operators, or else we're
br all going to lose out. If I hadn't known that this was something
br of an aberration, I would have developed a bitter feeling about ham
br radio in general and HF in particular. As it was, it soured the
br experience for the rest of the day. I realize that nerves were a
br little ragged due to the QRM problems stemming from the California
br QSO Party, but that doesn't excuse rude behavior that is
br detrimental to the hobby as a whole. Curt M. Breneman

Funny you should mention that. I've been very quiet on 2 metres in the
UK for many years but in July I was near Kendal on holiday and thought I
would ask after an old G3 friend so I made a short call through the
local repeater.

Three people came back to say that you get funny types using the repeater nowadays, who haven't paid lately.

In spite of stories about Scottish parsimony, I think it is safe to say that passers by are VERY welcome to use Scottish 2 m repeaters and are not expected to pay.

Evidently the comradehsip we have been used to in amateur radio is no longer all-pervading. Now get off my bandwidth.

I just got in to the hobby, not on the air yet but I passed the no code tech tests. and am waiting for a call sign.

I got an HT and have been using it as a scanner and listening to the nets on 2 meter and 70 cm. I'm looking at a booster for the car and further down the line a base or repeater at home, that is far off though.

Er, Yes. I have to scrape around and find substitute tubes, circuits, string, etc because I have not been earning for a few years. I find the discussions, tips, hints on these groups very helpful. I also learn a lot of "abstract" stuff like it's silly to use 6L6s just at the moment; but I know there are 101 tubes I can use instead, which have not been laid upon an altar by hi-fi magazines.

And suchlike.

4108. Update 23cm data-transceiver

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-04 00:00:00 UTC
From: PE1JPD <bdj@dutch.nl>
Message-ID: <6v80mt$dj9$1@newnews.nl.uu.net>
Source record: 22282

To those it might concern,

The 23cm data-transceiver at my homepage http://www.dutch.nl/bdj is now updated to Version 2.3. Compared to older versions (1.0 and 2.0) the following
improvements have been implemented:

1. output power increased from 1 W to 2.5 W
2. RX-chain is switched off during transmitting
3. some minor changes in the schematics and pcb
4. the software (V3.0) supports now 4 channels normal/reversed

The (english) text is revised and construction and tuning details are added as well as the assembler-file (V3.0) to be programmed into the microcontroller.

Currently a new project is under development: an easy to build and cheap 10 GHz link transceiver intended for high-speed packet links (up to 500 kbps). Details can be found on my homepage.

I've just gotten an old PAKRATT-64, complete with vintage Commodore 64 computer, and I need some help getting it up and running. I'm trying to get a young ham just starting out set up on packet on the cheap.

I have no documentation. The computer works fine, and when I hook up the PAKRATT-64, the TUNE light goes on and off with the C-64. However, I can't seem to make anything else happen. The C-64 is in BASIC mode. Is there separate software to run the PAKRATT, on cassette or plug-in ROM? I was hoping the PAKRATT had a ROM in it that the C-64 read and then executed; if so, what is the command to make that happen. Any help, advice, or source of documentation will be greatly appreciated. Please email if you have any info. Thanks, and 73...

I'm still spending money on it, so I better be enjoying myself.

Seriously, I just bought my first HF radio, a Ten-Tec Scout. I
consider it motivation to upgrade, since with my Tech + licence
is a bit short in the HF privileges.

Today I built my first antenna, a long wire approximately 150 ft long.
Tomorrow I contemplate a 10m vertical. This to give me something
to do on the air while I try to relearn enough code to be
intelligible.

Am I enjoying myself. I don't know, I am too busy to notice. :)

I have a MFJ-1274 TNC and an Alinco DR-1200 data radio. I am having trouble staying connected to our local DX packet cluster. The cluster is full scale at my location. I connect everytime I try but I stay connected anywhere between 5 minutes and 16 hours. I want to stay connected 24 hours a day which is no problem with the SYSOP but I can't for some reason. I do not want to use the CONPERM command yet till I can get a reliable and stable connection. I have used several software packages and they all respond in the same manner. I believe that I have something set wrong in the TNC configuration but I don't know what. Any help would be appreciated.

Thanks,

Dave

Hi John

Well, to answer your question as quick as possible. YES !
I am still on the air, first licensed in the early 1960's. Been
on the air ever since. I still build some gear, but not as much as
I used to. I have a shack full of Heath kit gear that helped teach me
soldering techniques, as well as trouble shooting. I enjoyed it so
much that I did make it a career. Just retired after 34 years as
a communications/radio technician. Worked on UHF and VHF
radios, handheld, mobile, base stations, repeaters etc. Also was
involved in data communications.

I won't begin to think that I could build a solid state SSB multiband
transceiver from scratch, but I do enjoy building regulated power supplies
and various shack accessories as well as various antenna's.

It was and still is a GREAT HOBBY, and the interest even put
food on the table and clothes on our backs. We, being my wife
and daughter.

I think we get out of a hobby, just exactly what we contribute
to it. I have had the pleasure of making friends all over the world
via HF on many different modes. I hope to continue on doing
so for at least another 30 years. I'm 55 now, so there is a good chance.
Not to mention all the new friends I have made by helping instruct
during the Ham Classes every year to help others become Hams.

As far as getting on the air, I do every day. Even if it's just for a quick
single contact. I also put some vintage gear on the air (made in 1943)
on November 11th. Of course it is on CW, and I issue a special colour
certificate and QSL card for anyone brave enough to have a 2-way contact
on 40 meters with me. I take great pleasue using that particular piece of
equipment (an old army WW II # 19 set) as it is also 55 years old.
We both still function, after all that time.

Sure, Art, but digital modes don't need all that much QRO anyway.
400 watts is beaucoup plenty. I rarely run as much as 50 watts, and
basically work anyone I can receive. The only problem with turning
down rigs or amps is that the IMD typically gets worse.

These external amps are designed to run at their rated output, and
when you turn them down, they don't get cleaner. A well designed
grid driven tetrode amp may be cleaner for this type of operation
than a typical cathode driven triode amp.

>re-engineer the kit from the ground up.

Well maybe not from the ground up, but you certainly will want to make
some changes. Don't just tune the rig for maximum output. That will
assure a spectrum which looks like a comb. Use a spectrum analyzer.
You'll also want to modify the design to mute transmission during keyup,
otherwise the rig will sweep across the band as it locks up. Nasty.

You're probably better off with a crystal controlled rig. Ex-land mobile
rigs (Motorola, GE, etc) are generally best for dedicating to packet.
And they're also generally cheaper than the Ramsey kits too. But if
you want to build a kit, the Hamtronics kits are a much better choice
than the Ramsey units. (The Hamtronics stuff isn't all that wonderful
either, but it is cleaner.) You might also want to look at Ten-Tec's
2m transceiver kit. I haven't tried to use one of those for packet,
but my general impression of the design is very good. Ten-Tec
doesn't put out junk, and factory support is very good too, they're
very helpful to kit builders (though that help might not be cheap if
you have to make an international call).

>I get a reliable and stable connection from the TNC to the cluster.

There are many possibilities. Try "MCON on", MCOM on", "MALL on" and you
should be able to monitor what's going on, which might give you a clue.
Or you can have some other station monitor the channel to see what
exchange of packets is causing the disconnect (excessive retries, etc.)

CONPERM shouldn't cause any problems and might fix the situation by
itself.

Gary's quite correct on this point - however, be aware that most of the
older land-mobile radios are phase-modulated, which makes them fine for
1200 baud but unsuitable for 9600 baud. Some land-mobile radios are
true direct-FM, and fine for 9600 baud, such as Maxar, Mitrek, Flexar
and most any radio which offered DPL as an option.

Hi Curt,

I've noticed similar things with some of the various nets and some operators in general. Personally, I never use the DX nets, I'd rather work them on my own. Anyone can work DX if the guy is waiting to hear you. If you can't, you'd better be thinking of a new antenna system. However, in the support of these nets, they do tend to lesson the QRM on the bands by keeping things a bit more orderly. I've learned to just ignore the attitudes of some of these people. I think that maybe a lot of them are bitter old men (not to say that all old men are bitter, hell, at 47 I guess I'm considered an old man HiHi) who long for the good old days of tubes, crystals, AM and resist change and things they don't personally like at all costs. For instance, this last weekend during the Cal QSO party, on every band I operated someone would show up and throw a carrier on top of my cq's. Since I have a modern radio with auto notch they weren't very successful in bothering me but they might have chased away a few trying to call me. I'm sure it wasn't directed at me personally since I've never made an enemy on the air (that I'm aware of). I'm sure it was just some dork who doesn't like contests since he's no good at operating that mode and figured that he'd single handly run everyone off the band. It didn't work. The contest continued without his approval. Probably someone who tells the same story to the same guys on the same frequency at the same time everyday and just didn't know what to do for and entire day without his 'sked'. Pretty sad person in my opinion! I don't understand it anyway, everyone knows when the contests are (if they read QST) and could easily make arrangements to move their skeds way 'up' the band where most contesters don't go anyway. Just arrogance and stubbornness in my humble opinion. A few contests ago I heard one old coot literally screaming at someone to move off 'his' frequency. The poor guy eventually did, only to have someone else move in a bit later and start calling cq contest so he gained nothing! When there's a contest, the bands are crowded, get over it guys!

Jim
Call withheld to avoid future carriers that might be directed at me personally

John OM,

I am happy to answer this question. YES!
After 43 years of being continously active on the air, I am still of
the opinion that ham radio is the world's best HOBBY (and I have a few
others to compare it with, too). I am on the air daily, CW mobile, and
will be back on from my (new) home QTH as soon as I get my tower
re-planted and the HF arrays back up on top. I'm a CW op mostly, but
enjoy FSK too. I run homebrew XMTRs and RCVRS as well as older gear (in
my experience, homebrewing has never been easier, cheaper, or more fun
than it is today, contrary to what I hear from those who do not engage
in it). Also, there are an awful lot of excellent ops out there, which
(still) makes ragchewing such a pleasure. CU on the air.

73,
Don, W6JL

hi,
I am looking for data transceivers for the 70cm-Band which meet the
ETSI ETS300113 spec. I need them for qrl, as well as for amateur radio.
characteristics desired in short:
12V=, 1..6W Pout, PLL, bitrate up to 9600bit/s
I know there are a lot of manufacturers selling modules according the
less strict directive ETS300220 but I didn't get a supplier for the
'113 directive till now.

Please drop me a short mail. mni tnx, vy73

Curt,

That's the problem with most DX nets--only interested in a 59 and a QSL. I'm not knocking that, but if you want more, try calling CQ or look for DX stations other places on the band. Seems like the phone pile-ups have been rather unruly lately. Try CW--it's a bit (just a bit at times) more civilized.

4130. Software RTTY and Pactor suggestions

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-05 00:00:00 UTC
From: Rick Williams <mrfarm@frontiernet.net>
Message-ID: <6vc2ti$5dk$1@node17.cwnet.frontiernet.net>
Source record: 22171

I finally got my Kenwood TS440 repaired after about 3 years of being inoperative on hf. I used to work some digital rtty, amtor, and even some Clover 2 (what a disappointment that was). Not only that but I could never get my HAL P-38 card to work well on Pactor so was forced to abandon it.

Used to have an AEA CP-1 Interface and still have the BMK Multy software for Rtty/Amtor.

As you know, when you buy a software program, it has an embedded call and is completely worthless if you change calls or upgrade etc. I feel that the authors charge way too much to get the right price point. After all, no one else can even use the software with embedded calls.

But am still entertaining the thought of buying a software version like Ritty that Brian Beezley writes. I understand he has a Pactor impementation out now. Has anyone tried this? He received rave reviews of his RTTY version but I wonder how well the Pactor version really is, especially for weak signals?

Otherwise, as an alternative, what do you folks suggest for a hardware approach? I am primarily interested in Pactor 1.

Actually, it is my first time, but I've watched them before
and it is usually not as entertaining as Seinfeld episodes...

You gotta pop in from time to time to see what is going on.

The Plan: The Wireless Web Cam (using ATV transmitter to let
me walk around the neighborhood and broadcast to internet).

What do you think?

Try XPCOM, it's available as a demo on the Web or the "official" PC-
Pakratt For Windows works fine though Win95. Let me know if you have
problems finding these.

Well, I patronized them numerous times before they moved to the new, smaller (horrible) quarters where you couldn't see or do anything. No wonder people would not go there. It was terribly small and they had almost nothing you could look at.

I was sorry to see it go, but are you sure that you are laying blame on the right source?

MRC was a great shop back when they allowed the meetings there, the library was great, and the store was easier to shop in.

The free parts exchange/magazine exchange was a great heolp to me, and the TUBE BANK was an awesome idea!

If only SOMEONE in the DC area would maintain a TUBE BANK now, I would certainly contribute to it and use it!

I was just sorry they had to move it from behind the Toyota dealer. After they opened the new place I only went in once. That was enought o put me off!

I will forward your comments to the DC BOATANCHORS mailing list and see if others have comments.

We lost the last packet BBS in the Phoenix area several months ago. I would like to start a new packet BBS but do not know what I need to get started. I have an extra Pentium 233 computer that I can either run Windows 98 or Linux operating systems and I have F6FBB BBS software for both Windows and Linux. What else do I need and how do I go about setting up my BBS. Any help from BBS operators is greatly appreciated.

Please reply to my e-mail address, tracker@dancris.com

4142. Problems, problems...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-06 00:00:00 UTC
From: adam@onramp.net
Message-ID: <MPG.10841176270697a598968d@news.onramp.net>
Source record: 22183

Hello, everyone. I recently bought a KAM+ with the idea of trying out the digital HF modes (AMTOR, PACTOR and so forth). It is an older unit, ver 7.1, with documentation that dates from '94 or '95. As you might expect, I have not had unqualified success in getting it to run much of anything. Sadly, the documentation helps almost not at all, so I am feeling quite confused about the whole deal.
Last night I did finally get CW decoded on the screen, but it was a very hit and miss affair. Unless the signal was just perfect, and the speed just so, all it would decode was a bunch of E and I characters. As far as CW decode goes, does it always work so hit and miss?
Regarding the other digital modes, I have had almost no success at all. The only thing that has been decoded was a very strong signal (one time) on AMTOR, and it was gibberish. Just a bunch of underscore, K and V characters. I love experimentation as much, perhaps more, than the next person, but this is getting silly.
Naturally, Kantronics tech support is available only between 1300 and 1500 on weekdays, so there is no help from that direction. If anyone can help me out, I would be very grateful. I live in the Dallas, TX area. If there are any Dallas digital hams that I could speak with that would be ideal (no long distance), but I will not turn down help from anyone.

The configuration of the total system is:

Kenwood TS-570
40 meter dipole @ 25 ft.
Antenna Tuner
Kantronics KAM+ with v7.1 code
Pacterm software
KaGold software (demo)
Windows NT W/S 4.0

Thanks!

73,

****

4144. Autoprint in RTTY for KAM+

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-06 00:00:00 UTC
From: sv1uy@nest.sv1uy.ampr.ORG
Message-ID: <22506.sv1uy@nest.sv1uy.ampr.org>
Source record: 22185

Hello all,

Has anyone managed to find a way to use an AUTOPRINT facility while in
RTTY with the KAM TNC please?
Autoprint is the facility that a few programs have so that no garbage is
printed when on RTTY standby and no valid RTTY signals are on the air.

My BMKMULTY with a homemade terminal UNIT does exactly this.

When I use my KAM with LAN-LINK 2.34 I cannot find a way of doing it.
A lot of garbage is filling the screen when on standby especially when I
switch the narrow crystal filters in line (i.e. 500HZ and 200HZ).

Any program I have used with the KAM cannot stop printing GARBAGE on the screen
when no RTTY signal is on the air. I think this is a pitty for an otherwise
nice multimode unit such as the KAM.

Any ideas are welcome please.

4145. Decoding MIR/Shuttle packets

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-06 00:00:00 UTC
From: ptaft@wang.com
Message-ID: <6vdtlt$22h@elf.wang.com>
Source record: 22186
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.space

Recently I've been able to hear MIR data transmissions on my scanner as they pass overhead. Since the transmissions are supposed to be regular X.25 packets, is there a PC program to decode these? I have tried Hamcomm without success. I have tapped the discriminator and also can use a soundcard. I can already decode other digital data, but not packet.

Any pointers or help appreciated,
Phil Taft

Source record: 22188

Take heart. First of all, CW works poorly or not at all on both my Kam All Mode and my PK-232 so don't make any judgements based on that. I too am running the TS-570 with a PK-232 and operate everything from the 13-pin din plug on the back of the radio. In addition, I have been running an Army Mars BBS 24 hours a day for five years now using the Kam All Mode and the KPC-1 primarily with HF and VHF packet.

Since you are getting communication between the TNC and your radio the fault may lie with parameters. Before you do anything I would suggest that you do a hard reset to return to the factory default settings which I have found to work quite well.

Getting together with someone local would be a big help once you have the hardware and firmware set up properly so that you can eliminate poor conditions as a reason for less than ideal results.

Good luck,
C. Jespersen K2OG

Try these params

Mark -2125
Space - 2295
Shift -modem

Should help out in the RTTY, Amtor, pactor...

(you are using Listen Amtor to monitor the amtor messages, it does sound
like you're in amtor mode trying to listen to RTTY or Pactor sigs)

Crank up your TXD to about 40.
Then start low, and go high. You should be able to optimize
in a few hours.

A deviation meter won't help much, as the tones are complex.
It will only be a relative instrument, and your own experiments
will be just as relative.

After you're done, crank the TXD down until the other end can't
stand it.

4156. Final Call for Beta Testers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-06 00:00:00 UTC
From: Rick Ruhl <ricker@cssincorp.com>
Message-ID: <uU4Hkra89GA.166@upnetnews05>
Source record: 22197

We've had a great response to the beta request and have decided to open a few more slots. The beta is still open for the following products.

HF Email '98: A Windows 32 bit AMTOR/PACTOR Eudora-like front end for HF Internet Email, support for WLO, Globe Wireless and Winlink. Requirements, Kantronics KAM, KAM Plus or Kan 98. (Timewave and MFJ versions supported in future releases)

WeFax '98: A Windows 32 bit Wefax program, Requirements, Kantronics TNC that supports the WeFax command. (Timewave and MFJ versions supported in future releases)

PacTerm '98 version 1.5: The next update of PacTerm '98, host mode program for Kantronics TNC's.

PacTerm /CE: A Windows CE host mode front end for Kantronics TNC's (support for Timewave and MFJ TNC's supported in future versions) Requires Windows CE 1.0/2.0 palmtop PC.

PK-Term '98: a Windows 32 bit host mode front end for the Timewave TNC line. Requires AEA/TImewave TNC (all supported from PK-87 to DSP-2232).

Multi-Term '98: a Windows 32 bit host mode front end for the MFJ-1278 TNC line.

Paging Server 2000: A Windows NT paging server for use with POSAG and TNPP paging. Works with Kantronics 9612p or Kantronics Paging Controler 2000.

For participating in the beta, you'll receive a free copy of the program when finished.

What we need from you:

Name
Callsign
Address
Phone number
Product(s) you wish to beta
Time you can spend per week on testing
Previous beta experience (other products with other companies)
Current computer configuration

Please email this info betareq@cssincorp.com.

Best regards,

The CSS beta team.

Hmmm. I am sure you will get some helpful hints here. Also, do a search on KAM Plus and various iterations, there are sevaral sites I have seen in the past with lots of discussions of using the KAM to great advantage on these modes.

I have recently taken a virus hit that Norton Anti-Virus missed, but if you fail to find something appropriate E-mail me directly and I will see what I can scrape out of the bombed-out HDD for site urls.

CW is not handled well by most multipurpose tnc boxes.

I have used a KAM+ with great success in the past, though I forget the details. I am sure someone here can help.

> Naturally, Kantronics tech support is available only between 1300
> and 1500 on weekdays, so there is no help from that direction.

Have you tried E-mailing them? They were very responsive in the past to E-mail.

4160. Help please - modem chips for one way digital wireless link

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-07 00:00:00 UTC
From: Sam <!nospam!sippe@uq.net.au>
Message-ID: <6velt1$1cb$1@news.bix.asn.au>
Source record: 22201

As our university project we have to implement one way digital, wireless RF comms between a computer and a small soccer playing robot based on the Motorola HC11 @2.4K. We were thinking of using the R2705 and FMT2705 (27MHz transmitter with shielded receiver) in conjunction with a pair of modem chips and were wondering if you had experience in this sort of application and could offer us some advice.

What we need to know is:

1. What would be the best modem chip to use for this job?
2. Is the transceiver we are looking at suitable?
3. How do we determine what aerials we need on each end?
4. Once we have the correct chips, is it simply a matter of connecting the correct com port pins to the modem pins and the modem pins to the transmitter module pins and similarly on the other end? Or will we need driving circuitry?
5. What would be the best way to mount the whole package?

If this is the wrong group for this question - sorry, what is?

Thanks

Sam Sippe

As you know, when you buy a software program, it has an embedded call and is completely worthless if you change calls or upgrade etc. I feel that the authors charge way too much to get the right price point. After all, no one else can even use the software with embedded calls.

Err, in both cases when I've bought software recently, I've gotten registration numbers for both my US and UK calls, and been offered the opprotunity to get numbers for other calls if I should need it. Don't paint all software vendors with the same color brush.

Hi, Rick. I think my experience will be relevant for you. I used to
use a CP-1 and BMK-Multy. Now I have both a P38 and RITTY by K6STI.

On Mon, 5 Oct 1998 20:42:34 -0500, in rec.radio.amateur.digital.misc
you wrote:

>I finally got my Kenwood TS440 repaired after about 3 years of being

>Clover 2 (what a disappointment that was). Not only that but I could never
>get my HAL P-38 card to work well on Pactor so was forced to abandon it.

The P38 FSK programming was not great when the P38 first came out.
It's a lot better now. Clover is actually wonderful, but there aren't
a lot of people on it. You can get new files at the HAL Web site:

www.halcomm.com

>Used to have an AEA CP-1 Interface and still have the BMK Multy software for
>Rtty/Amtor.
>
>As you know, when you buy a software program, it has an embedded call and is
>completely worthless if you change calls or upgrade etc. I feel that the
>authors charge way too much to get the right price point. After all, no one
>else can even use the software with embedded calls.

You can get a new call embedded for a nominal fee--it says so on the
front of my manual. Contact the BMK-Multy agent for the US:

SPHERETRON/Schnedler systems
24 Eastwood Rd.
P.O. Box 5964
Asheville, NC 28813
(704) 274-4646

However, you should know that BMK-Multy will not be upgraded to a
Windows program. You can't run it in a window or full-screen under
Win95/98. You have to run it in that special DOS compatibility mode
where the PC reboots and runs just DOS 7.

That said, BMK is a wonderful program, and I had many happy Pactor and
Amtor contacts with it. It also copies CW better than most programs.
And it does some nice digital tricks with AMTOR--but there's not a lot
of AMTOR out there any more. If you don't have the Pactor module, you
may want to invest in a newer program rather than throw money into the

>But am still entertaining the thought of buying a software version like
>Ritty that Brian Beezley writes. I understand he has a Pactor impementation

>out now. Has anyone tried this? He received rave reviews of his RTTY version
>but I wonder how well the Pactor version really is, especially for weak
>signals?

RITTY 2 does both RTTY and Pactor I, with the best copy I have ever seen in any program or TNC, anywhere. It also has a fast Fourier transform tuning display that is better than anything save a real scope, and even then it's a toss up. You need a real name-brand Sound Blaster card for Pactor. Not a real problem, as any 16-bit sound Blaster will do. The Vibra 16 can be had for about $40 last time I looked. "Clone" cards may do for RTTY only.

You can download a demo version of RITTY at:

http://www.megalink.net/~n1rct/rit2/rit_dl.html

Once you buy RITTY, Brian emails you a license file, and your demo version becomes registered. He updates the program periodically via the Web.

You can find some reviews of RITTY and comparisons to KAMs, P38s, and other TNCs on the following sites:

http://www.qsl.net/k7on/ (look for "TU comparisons")
http://www.n2hos.com/digital/index.html (find "The Learning Center")

One relatively minor issue with RITTY is that it's a DOS graphics program, and it can only run under Windows 9x in full-screen mode. It won't multitask in the background. So you can't monitor the bands while doing something else on the comptuter.

You can multitask with the HAL P38 software, or a third party Windows program like XPWin or EZterm. XPWin 1.2. has a few problems with Clover, which causes slow text chatting and occasional crashes, but it's a joy to use on FSK modes with the P38 or any supported TNC. The author is looking into the Clover problems. In the meantime, I'm using the HAL software on Clover.

>Otherwise, as an alternative, what do you folks suggest for a hardware
>approach? I am primarily interested in Pactor 1.

There are lots of used KAM and PK-232 units out there to be had. Many people are happy with them. But frankly, I found BMK-Multy and the CP-1 to be better than the PK-232 I once owned. So since you've already got BMK, why not see how much it would cost to get the Pactor module and your new callsign embedded? Compare that with the cost of another setup. I must say that with the P38 and Sound Blaster tucked away in my PC, my operating table is less cluttered than it's been in years.

For what it's worth, my order of preference is:

1. RITTY
2. P38

3. BMK-Multy/CP-1
4. PK-232 or KAM

These days I use RITTY for Pactor and RTTY, and the P38 for Clover and occasional AMTOR. I may also use the HAL if I'm doing other stuff on the PC, and just monitoring in case somebody interesting shows up.

Hope this helps!

(I have no financial interest in any of the products listed.)

It is usually not difficult to modify a PM crystal controlled radio for
direct FM. The GE Exec II and Mastr II are easily converted to direct
FM by driving the temperature compensation line of the channel element
for example. But the more daunting problem may be to broaden the
receiver IF response to improve phase linearity over the bandpass
required for 9.6 kb operation.

You can't do it. There are no cavities inside to filter out the 600kHz
offset. The filters are barely narrow enough to keep police/fire/pagers
out of the ham bands as it is. I think that somewhere in the manual it
states that the VHF/VHF and UHF/UHF x-band is also disabled in the firmware.

> for example.

This sounds good in theory but isn't so easy in practice. Have you ever
measured the deviation response of the GE ICOM circuit? The two elements
I examined had a very non-linear response with a maximum of around 800Hz
at transmit frequency. The ICOM line is essentially a binary switch to
deal with a non-linearity in the crystal's temperature response, not
a practical modulation line.

Sure, you can start tinkering with the ICOM circuitry in the channel
element, and I bet you could get a decent direct-FM response. At the
same time, you'd almost certainly reduce the overall frequency stability
of the element, unless you were really meticulous. In other words,
you probably could hack the radio for direct-FM, but it still wouldn't
be useful because it would drift too much.

A more practical example is the Motorola VHF Micors, which are normally
PM. There were some models made that were direct-FM - these use a different
channel element and a different modulation circuit. Well, in theory it
should be trivial to find a direct-FM channel element, plug it into a
PM exciter, and run a wire to the modulation pin on the element and
go to town. I know someone that tried this, he's quite skilled, and
even declared it not worth the trouble.

> But the more daunting problem may be to broaden the
> receiver IF response to improve phase linearity over the bandpass
> required for 9.6 kb operation.

Careful with this particular rule of thumb. Yes, an overly tight IF response can be a problem, but my experience with several radios is that what is normally attributed to poor IF phase response is actually something else. More often than not, it is a result of poor and/or inconsistent set-up, and/or transmitters/receivers that aren't adequately frequency stable. It is also easy to confuse non-linear FM detector response with IF filter phase distortion.

In at least one case, I've seen someone butcher a radio to "solve" the IF phase distortion problem, when the real issue was the receiver is not adequately frequency stable.

I've come to regard the IF phase distortion issue for 9k6 as generally a non-problem that people try to solve anyway, ignoring or compromising the system in other places. Sure, there are many examples of where IF phase distortion *is* a concern, but it pales in comparison to such things as frequency stability and deviation adjustment.

As an FYI, PacTerm '98 allows for up to 10 different callsigns to be used,
and each one of those can be replaced by a new call.

Family calls, MARS calls, and call sign changes are FREE for users of
PacTerm '98, as well as FREE UPGRADES to the product. No nickle and diming
the user to death for a 1.1, 1.2, 1.3 etc version upgrade.

PacTerm '98 is $69.95

Just acquired an AEA DSP-2232 and noticed one of the dsp modems was for SSTV. Wonder if there is any SSTV software that supports the 2232?

Any help would be appreciated.

>73, doug

I didn't state that quite right. My point that I was trying to say is that unlike a physical box or board, the software is not transferable.

I was aware of the possibility (even though incredibly inconvenient and requiring yet additional expense) of getting another embedded call. Assuming that the company or author is still available.

The software, in my opinion, should be very low cost since the author never has to worry about illegal copying etc. I believe the price point is higher than is smart business. At least in my case that is sure true because I have not bought any more embedded software in the 100 bux class or higher. And when I bought BMK Multy, I was given incorrect information from another person who indicated that it did NOT have an embedded call.

I have always regretted buying the software. If I had put the money toward a box, it would have been a better value long term. Now I have a product with no value.

Maybe that's because you don't understand the reason for it, Mike.
The driving factor for many HF operators is the DXCC award. Last
nite, on 15 meter CW, I worked 423 stations in Europe in about 3
hours. A few probably called for pileup practice, but most of them
just wanted a contact for a 'new one', another QSL card. I probably
worked 95% of the stations I could hear, but I didn't work everybody.

I wouldn't have had many, if any, meaningful conversations if I had
spent a half hour per contact, instead of 20 seconds. And the end
result is all the same. Nobody called me, they called my QSL card...

They get a new one, I get warmed up for the next CW contest.
We are all happy. Nothing cold about that.....

I've used the Ramsey on 9k6. The trick is to get the adjustment RIGHT on the little TX trimmer cap. It's switched in/out of circuit when going between Tx/Rx to reduce settling time of the VCO (a really good idea that the "big boys" should consider!). Biggest problem is that the Rx is really crappy! I finally sold the Ramsey and got a Motorola Mitrek. This rig is REALLY easy to modify for 9k6 and works GREAT. Got 4 of them running now and recommend them to anyone who wants to do 9k6.

I've used it wouldout a problem. Been a few weeks since I used it. But
from what I can remeber, you boot to DOS version pressing F8 when the PC
boots and then once you load up the Batch file you then type in WIN at the
DOS prompt and it loads up the needed VXD files.

This is a copy of my batch file I used once I'm in DOS to work in Windows.

```
FLEXNET
IF ERRORLEVEL 1 GOTO :exit
SMSBC /tc:2
IF ERRORLEVEL 1 GOTO :exit
FLEX
IF ERRORLEVEL 1 GOTO :exit
SMAFSK12
IF ERRORLEVEL 1 GOTO :exit
FSET MODE 0 1200
FSET TXDELAY 0 50
SMMIXER /s:line /o:0
GOTO :end
:exit
FLEX /u
:end
```

Sure you can. You have to clip out one capacitor in the ICOM, and then
it modulates nicely. If you sum the temperature compensation line with
the modulation (use an opamp), you can maintain temperature compensation
too. BTW you can use the temperature compensation line of the receive
ICOM for doppler correction if you work the 9.6 kb pacsats. It easily has
enough range (UHF radios). Again, use an opamp to sum the doppler
correction with the temperature compensation.

>the system in other places. Sure, there are many examples of where IF
>phase distortion *is* a concern, but it pales in comparison to such
>things as frequency stability and deviation adjustment.

Well naturally I assume those routine things have already been addressed.
In the Mastr II, the IF fillters have too much phase distortion near the passband
edges to give a good BER. (I consider good to be less than 1 error in 10^5 bits.)
That's because they have a very sharp Chevechev response. There are a couple
of approaches to this problem. The simplest is to remove the first IF filter and
replace it with a RC coupling network. That works, giving a simple gaussian
response with good phase linearity, but the radio's SNR and immunity to
nearby strong signals is reduced, of course.

The better solution is to replace the filter with one that has better differential
phase response. That generally means a filter with a broader passband and
a gentler shape factor to stay away from the phase shift inherent at the corner
frequencies of the filter. That costs you some SNR and a bit of nearby strong
signal rejection too, but not as nearly much as simply bypassing the filter.

The discriminator used in the Exec II and Mastr II is a bit odd. It is not zero
center. You have to remove the 2.5 volt DC offset before feeding the modem.
An opamp works for this too. But the difficulty in finding a replacement IF filter
with the right characeristics for these radios, coupled with the odd discriminator,
may make it more practical to replace the IF strip and discriminator with a
more modern IC design, and just keep the excellent front end and first mixer
of the original receive strip.

OTOH, Micor receive strips are usually usable as is. The Maxar receive
section is sort of a weak sister by comparison to the Micor, but early Maxars
will work as is too. They aren't nearly as robust as the Mastr II, however.
The front end of that radio is stout with respect to nearby strong signals,
so it is generally worthwhile to modify it if you need a radio for a high site.
And of course it bears repeating that these radios are excellent as is for
use at 1200 baud. They'll live on a high site when virtually no other radio

will.

I picked up several Mitreks for $50/ea, clean as a whistle, with control
groups (though you don't need the control group for packet). Channel
element set-up at ICM was another $65. For under $120, I had a radio that
far outperforms a Ramsey kit ($160+).

While Gary is ready to encourage people to tinker with channel elements
on GEs, I'd rather just use PM radios for 1200 baud and obtain a direct-FM
radio like a Mitrek for 9k6. It is so much easier and the results are
so much more consistent, it is worth it.

Hi Ramesh,

I'm currently design the transmitting side of such a device, using a 16f84. Basicly it takes serial stream (well actually about 12 bytes), formats it, then fires it out as an AX.25 frame. In the near future I'm going to work on a KISS implementation, and then work on recieving packets.

So really I'm not designing modems, I'm working on a PAD (Packet Assembler Dis-assembler). If you just want a modem then may I suggest you use your PIC to control a CMX589A modem chip. Basicly it is 4K - 200k bps QMSK modem chip.

MX COM appears to be THE company with modem chips. Take a look at their website www.mxcom.com, and then request a data book if you are serious. They also have some Bell 202 (1200 baud) chips. Of course there is the venerable TCM3105, but they are no longer available, so I wouldn't base any designs on them.

It sounds like we are both fiddling in the same dirrection - keep me informed.

As far as material to get started :

- get a copy of John Hansen W2FS's paper in the 1998 DCC procedings.
http://www.tapr.org/tapr/html/cnc17.html

- read the AX.25 spec
http://www.tapr.org/tapr/html/ax25.html

- read kiss spec
http://www.deskmedia.com/~jjeffers/packet/kiss.txt

- read the TAPR's 9600 modem manual
ftp://ftp.tapr.org/tapr/info/kits/manuals/9600_modem_man.pdf

- Baycom's various modems
http://www.baycom.de/tech/index.htm

- the manual for Tigertronics BP-96A
http://www.tigertronics.com/files/bp96aman.pdf

- TCM3105 Data Sheet
http://www.best.com/~wdunckel/TCM3105.PDF

That should give you a start... =)

I wonder is this is why I am having problems. Flexnet seems to recognize
the Soundblaster (AWE64) okay, but the soundcard diagnostic program gets an
internal error. I'm running from DOS, but I'll try this tonight.

What terminal program is everyone using? Is BayCom (bct.exe) the way to go? Is
there anything more simple?

Phil

Did you visit the website?

I was kinda impressed by the shot with kiwi fruit that had that same rainbow sheen you see in bad sliced meat.

I'm holding my breath until the first quarter 1999 to be the first on my block to own one of these. Of course since I normally shoot more than 30 shots at a time, I'll need several.

We are less than 30 days away from the Odessa Texas 15th Annual Hamfest!

If you haven't been here, don't miss this year! Lots of prizes, hidden transmitter hunts, lots of door prizes, lots of fun. We fill 21,600sq ft of space with over 200 tables of vendors & hams. Yes, we are not the largest fest around.... But, we like to think it's a fun and great fest. Ask any of the dealers that have been attending for years.
Texas Bugcatcher
The Ham Store (KCOMM)
WB0W
Rad-Com Radio
and many more...

This year is the first year we have had online & secure registration. No, you do not need to attend to be eligible for the major prize drawings on Sunday. And, any unclaimed registrations are put into the hopper prior to the major drawings on Sunday. Hey! Come check out the Sunday Lunch/BBQ!
Prizes include:
Alinco DX-70T
ICOM 2710
ICOM T7A
ICOM T2A
ICOM T2A (yes, two of them)
ALINCO C1T (2 of them)
ALINCO C4T (2 of them)
COMET GP-6
And...possibly a full computer w/monitor...still working on this prize.

Check out our webpage at: http://nonprofit.apex2000.net/hamfest/

I wasn't. Dull colors, stuck pixels, poor sharpness, and some evidence
that the pictures were actually shot at 640x480 and resized *up* to
make them look like they'd come from a larger sensor.

>I'm holding my breath until the first quarter 1999 to be the first on my
>block to own one of these.

I wouldn't hold anything, since that's more than a year after their
original release date, and they blew the demo at the biggest photo
show in the world last month. They don't have a product yet.

>Of course since I normally shoot more than 30 shots at a time, I'll
>need several.

Buy one to show off to your friends, and spend the rest of the money
on film.

4196. GUI Packet Browser software?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-09 00:00:00 UTC
From: spkatzmann@beckman.com
Message-ID: <6vlu4ijcc1@nnrp1.dejanews.com>
Source record: 22044
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc

I am considering developing a Win 95 packet browser program (I'm calling it WEB-Packet). It would look and work something like a Netscape for packet radio (alot more limited and slower of course). I think that it would let alot more hams enjoy packet radio and spark a whole new way of looking at packet just as WEB browsers have revolutionized interest in the internet (for those of you that used to be Arpanet users like me :-). Initially I envision various windows with various fonts, limited graphical library, and various buttons etc. With, of course, hypertext and linking support.

I am going to use a conventional WEB page editor to generate crude test pages and begin working on the on-line decoder for now.

Anyone else considered doing something like this, and is there currently software out there being developed or already available to play with?? Any help or suggestions are welcome.

Steve. WA6MUO

I've never needed to use an amp with Clover, but the timing
constraints are not as tight as for AMTOR, so an ordinary
amp should work.

I'm really not sure of your position. Are you against the concept of converting a 35mm camera to digital or is it a problem with IMAGEK only?

IMAGEK may not deliver what you desire in this type of conversion but someone will someday.

Hello,

Winpack,http://freespace.virgin.net/nigel.dyche/ , has an extra called
WinpScape, if I understand correctly that allows Netscape use the packet
TNC. Haven't played with it at all, I'm the Winpack Lone Ranger in
these parts, besides I don't have a particular interest Web style packet
operations...

The only tricky part I found was that I had to add...

set blaster=a220 i10 d1

... to the script (before "smsbc")

```
rem lh?
FLEXNET
rem loads the FlexNet Kernel module
IF ERRORLEVEL 1 GOTO :exit
set blaster=a220 i10 d1
SMSBC
rem /tc:1
rem loads the SoundBlaster driver, PTT output: COM1
IF ERRORLEVEL 1 GOTO :exit
FLEX
rem activates the FlexNet Kernel
IF ERRORLEVEL 1 GOTO :exit
SMAFSK12
rem loads the 1200 Baud AFSK modem
IF ERRORLEVEL 1 GOTO :exit
FSET MODE 0 1200
rem sets the SBC driver to AFSK 1200 Baud
SMMIXER /s:line /o:0
rem sets the output level to maximum and input to line
GOTO :end
:exit
FLEX /u
rem unloads FlexNet in case anything went wrong
```

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST-COMPUTER SHOW - OCTOBER 25, 1998

LINDENHURST, LI - NY

On October 25, 1998 the Great South Bay Amateur Radio Club will again
sponsor an indoor Hamfest-Computer Show. The location will be at the:

Knights of Columbus
400 South Broadway, Lindenhurst, NY.
This is an ARRL approved Hamfest.

There will be radio equipment, electronic componets, computers and
access-
ories, softeware, books, technical manulas, ARRL information, Amateur
Radio
License Exams, Door Prizes.

Advanced registration is $15.00 each table. Tables at the door are
$20.00
each. Contact Peter Portanova WB2OQQ at 516 541-4886 for table
reserations.
NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the space
available.

General admission is $ 6.00. $5.00 with coupon. (Coupons will be
available
at the door.)

VE - ARRL - 12:00 NOON
For exam candidates please remember to bring your original FCC Amateur
Radio license (if licensed), any C.S.C.E. forms that are pending, plus a
photocopy of each, pens, calculator, formal form of ID (preferably photo
ID),
and the examination fee, to the exam seesion. 1998 ARRL/VEC fee is $
6.35,
exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL.

Food Service during the Hamfest will be provided by members of the
Knights
of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm following the Newsline Report on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

I have a serious problem with McGill's administration and I need your immediate assistance.

I am a student in the Chartered Accounting Department at McGill University.

On October 1, 1996, I started working at McGill University's Center for International Management Studies (IMS) to reconcile funds provided by the World Bank to the University.

However, I noticed that McGill's administration had been manipulating the accounts and falsifying the reports. The manipulations amount in the hundreds of thousands of dollars.

When I reported what I saw to the University's Internal Audit and to Professor Bernard Shapiro (McGill's Principal and Vice-Chancellor), the University expelled me from the CA program, claiming that I failed my exams. I wrote excellent exams, but McGill rigged the marking to stop me from reporting what I saw at IMS. Please contact Professor Shapiro at SHAPIRO@UMS1.LAN.MCGILL.CA and ask him why the university rigged my marks.

I tried to settle the matter with the University's Ombudsperson, Mrs. Estelle Hopmeyer and with the Legal Clinic director, Mr. Alex Pless, without success. When I went to see Mr. Pless, the University's security hastily dragged me outside the University. This action is a gross breach of the University's own Charter of Students' Rights which allows me to contact Mr. Pless.

My conflict with McGill's administration reached the University's Board of Governors and Audit and Finance Committee, but nobody listened to me.

I lodged complaints against the chairmen of McGill's Board of Governors and Audit and Finance Committee with Quebec's Order of Chartered Accountants, since the chairmen of the above committees are both CAs. However, I was given a mock hearing at the Order, and the President of the Committee on Discipline ruled, unjustly and unfairly, in favor of McGill's chairmen. You can understand why, can't you? You could confirm the details with Mr. Nicholas Chagnon V.P. Publications.

The lawyers whom I contacted so far are not defending me. I suspect that the Dean of Students Professor Rosalie Jukier is influencing these lawyers not to defend me. Please go to the office of the Dean of Students and ask her why is she stopping my lawyers from defending me.

To silence me, a collaborating judge ruled that I may not contact anybody at McGill. He also ruled that I am not allowed to be on the University's campus, although I did nothing wrong. You must contact me to see my evidence about the funds manipulations at IMS and to reestablish justice at McGill.

The University sent me to jail although I am innocent of the harassment charge which Dr. Lees is accusing me of. Dr. Lees sent me to Riviere des Prairies Psychiatric Detention Center, alleging that I have been harassing the university's staffs. This is not true, since I was only questioning the staffs about the suspicious funds manipulations.

Now I am out of work, cannot continue my education, and the University is suing me for criminal harassment. The court ordered that I undergo mental evaluation. A conspiring psychiatrist alleged that I suffer from delusional disorder of grandiose type. This is a lie that is intended to silence me. Will you help me report my psychiatrist to the appropriate authorities?

You might want to confirm the above facts with McGill's Secretary-General, Dr. Victoria Lees at: LEES@UMS1.LAN.MCGILL.CA, but I advise you not to, because she will give you false answers.

Other strange events happened, and I will tell it all to you after you contact me. I request that you communicate with the University's reporters, student groups, the students in the CA department and your colleagues to expose the World Bank funds conspiracy at IMS.

This could happen to you or to your friends, so you must help me put an end to McGill's injustices. Also, I need your assistance. My family and I are in a desperate situation because of McGill's emotional and financial pressures. Would you help us in this respect?

Please respond and take action. Thank you for your collaboration.

I have a serious problem with McGill's administration as well so I
will be quitting the study [degree program] by the end of this term...

doing something else from winter.
Too bad that McGill is losing the students like we are.
I will be posting these articles in concordia.general, can.general
etc. and you should do the same to avoid getting excellent students in
this fuc*king university.

>Students and ask her why is she stopping my lawyers from defending me.

well... if she has 1 billion in her pocket and pass it to the lawyer
whomever you hire... what happens ? probably you shouldn't think
of lawyers but just to take this university court directly. It [this
university...] is ridiculous. I have enough evidence to win court
battle.

>To silence me, a collaborating judge ruled that I may not contact =

yep. they will do whatever they can do to prevent you from finding
out the evidence. Thanks for your post. I will be using this as
well to kick this university's staffs out of their administrations.

****
I talked with one of the students here and he told me that professor
changed the course outline after the final exam is written. That's
not acceptable. (i.e. changing the final exam weight from 50% to
2/3 of final mark). It is ridiculous. Just keep up posting and
I will post my stories also.
****

YES !!!!! Let's sue this university. I am serious about it. With
series of events like this, I am sure that the ones who are in charge
of this university MUST BE KICKED OUT from this institution.

> Also, I need your assistance. My family and =
>I are in a desperate situation because of McGill's emotional and =
>financial pressures. Would you help us in this respect?

I will be putting my money if you and others are willing to take this
university to court etc. in question.

Just to let you know... there are students who know and who care about
the ongoing incidents at this university.

I don't want to discourage your efforts, Steve, but why not just use Netscape?
Works for me. Of course I use a TCP/IP layer between the browser and AX25.
This is virtually "plug and play" under Linux, haven't tried it under Windoze.
I understand there's a shim for that which lets the native TCP/IP work over
AX25 too, but I haven't tried it.

You're talking about a stand-alone program then? That is, it will work directly with the TNC or SoundBlaster?

That's probably not a bad idea, as the only competition is the winpacket type, and dos programs.

You might consider KISS to the TNC, as then you can write your own protocol. Maybe consider one of the FEC (Forward Error Correction) protocols that Phil Karn (ka9q) has published:

http://people.qualcomm.com/karn/dsp.html

The idea here being that you can compress (gzip, or Huffman) and FEC the lower layer to get the most out of real-time packet.

The amount of retries on packet (with its poor infrastructure) is mind-numbing.

On the other end of the spectrum, is a neat idea from wa0ptv called HamWeb:

http://www.tapr.org/~wa0ptv

This uses a 100% duty cycle transmitter to send data all day/night, and you can provide it data to transmit on another frequency, etc. The program given, isn't very useful past a demo, but it's an interesting low-baud idea.

Body handling: HTML body converted to readable text

Steve, this looks like an excellant idea, and I hope it carries through. In the early 90s, there was the conventional term software called RIPTerm, which you may (or may not) be familiar with. I was sufficiently low bandwidth that I got very good use out of it, even on 2400 baud...

I would base your project on an HTML-like language, however, I wouldn't use real HTML, so as to discourage would-be users from using standard composers (MS Frontpage pops into mind) which can produce very large code which isn't suitable for packet purposes.

Every formatting tag could be accomplished using a sing character code... for example, &B would bold, and %B would disable. Very similar to and but eliminating wastage of bandwidth.

A limited graphics set is a good idea, for common functions and menus such as mail, etc., and if other graphics were kept to, say, less than 5k, the BBS could send that data once, and only send it again if needed... so a database on your server would be a good idea. It could even download certain items the first three times a user logs in, so as not to hog a frequency. For example, the client software would already have common items such as mail bulletins, etc. available as icons. The first time I logged onto the BBS, I would get the custom logo of the BBS, and I would also get a picture of the sysop. The next time I logged in, I could send my own picture (or representation- an avatar.) and would receive a flow chart or something of the BBS- a map. The third time beats me, but I'm sure you could think of something. :-)

I'd also consider some sort of vector graphics protocol, maybe even a condensed version of EPS. This was one of the terrific features of RIPTerm, and made some really impressive displays possible... even rectangles around text boxes impressed me. :-)

Colour could be implemented very easily through a 4-bit (16 colour) system... for this sort of thing 16 colours is just fine, although, you can be more creative with 8 bits... although 4 bits can be precious space on a 1200 baud link.

Consider implementing sound in the AOL "You have mail!" fashion. This could really bring your software up to date with those who aren't easily impressed.

Last but not least: Make your system as fast and efficient as possible, even over a 1200 baud connection! Frequently used terms such as "amateur

radio" or the call sign of the BBS could be shortened to !AR and !CS and would be re-constituted on the receiving end. I know it is tempting to go with a 9600 if you have the capability; however, a new ham who only has a few bucks can only afford a transceiver and a used TNC- that's my situation, and that of many others. Maybe your software will be able to detect the login baud rate, and filter content appropriately.

I will be setting up a packet BBS shortly in Richmond, Ontario (Just west of Ottawa) and would love to test your software out- the server is a Redhat Linux 5.1 x86... other serving stations will be using Linux as well, so pick your programming well. :-)

Well, I'm off. Hope that wasn't too long, and I've probably got more ideas stuffed in the back, there, somewhere...

Of course when you don't need to have everything in one stand-alone
program (who does?), what you want to make already exists.

Use the TCP/IP protocol that others already designed and has been
implemented, and use the existing Netscape browser on top of it.

When you really don't want to use TCP/IP (why?), write a winsock compatible
interface to your own protocol, and you can still use Netscape as the
browser and HTTP as the browsing protocol.
Just invent your own, more efficient or more suitable to radio, link level
and transport level protocols.

I've been using tcp/ip on packet from the NET days (great team project
by Karn and Bdale, others). But I'll be honest, the MAC layer we use to
transport tcp/ip really sucks.

AX.25 is worthless on HF, and it is marginal on VHF. There is no FEC,
and there is no reliable link. How many of us waited for TCP to recover
the link, when the real problem was the layer 2 protocol. The whole
emphasis of adding BBS to NET/NOS was to #1 interface to the BBS,
but more important, #2 the BBS was so simple in technology, and was
a loss type protocol. That is, if the message got lost, who cared!
IP on the other hand wouldn't budge until it got that damn message
through the band opening.

I don't have a problem with this direction (using tcp/ip), but if the answer
is, we are going to use AX.25, then I'm going back to cat breeding.

Here's the deal. We need to Axe AX.25. Pactor and Gtor have already
blown it away on HF. Now that everyone has upgraded from their
5 MHz 8088 boxes, and even their junk computer is a 486, we can
move on with a lowest common denominator that replaces the modem
IC with a software algorithm. That algorithm MUST include a
reliable layer 2, with retries measured in days.

Only then, will TCP/IP work.

Until then, a good packet project would be a netscape looking dumb
terminal that implemented an FEC algorithm, and did NOT use AX.25.

Do it, have a ball, and forget the off the shelf crap. Off the shelf AX.25
and TCP/IP are a lose-lose proposition.

Adding FEC on VHF/UHF is often just excess overhead if the RF engineering is done correctly. And there is little excuse for not doing the RF engineering correctly, except perhaps in cases where you're contending with military radar, or overly long paths in a sparse topology. I'd also note that FEC isn't necessarily a layer 2 issue. It can be done at the physical layer. Dale has done that with the second generation 56 kb RF modems. FEC is done in hardware below the link layer, and is transparent to it.

The main problem on VHF/UHF is packet collisions. LAN engineering to avoid hidden terminals helps collision problems a good deal, probably more than any change in the link protocol could (short of going to token ring anyway). Use of full duplex packet repeaters significantly reduces collisions, as does proper coordination of LAN and trunk frequencies.

When those physical layer issues are properly addressed, as they should be, then AX25 UI frames make an adequate MAC layer. They have more overhead than is absolutely necessary, but it is tolerable for the convenience of having MAC addresses map directly to call signs. Connected mode AX25 is a lost cause and should be avoided in most cases. Leave that as a layer 4 issue between the hosts where it belongs.

We don't have to invent new link level protocols to have satisfactory packet switched networks on VHF/UHF. In most cases that's just putting a bandaid on a cancer. The real problem is addressed by fixing the physical layer.

If the links are poor quality, of course, then performance suffers. On HF, the links are almost always poor quality due to skywave multipath, changing propagation, and interference. We can't fix that with RF engineering (though we can help the skywave multipath problem by using diversity techniques). Use of FEC on HF is virtually mandatory. And intelligent link layer retry mechanisms are needed. AX25 performs very poorly here.

Clover II makes an attractive MAC layer for HF. Its lack of need for a deliberate "over" makes it quasi-duplex, and that makes it convenient for use with slip or ppp. PACTOR I & II require a deliberate "over" and that means they aren't well adapted as a proper link layer, IE they aren't transparent to the layer above them. And Clover's

good signal design, strong FEC, and good retry mechanisms make it robust.

Adding an ALE capability to the HF MAC layer would be advantageous, but none of the current amateur protocols transparently support that, and current regulatory limitations on unattended HF operation make it a somewhat moot issue anyway.

So, with proper LAN engineering, AX25 UI frames form an adequate MAC layer for TCP/IP on VHF/UHF, and Clover II supplies an adequate MAC layer on HF when used with slip or ppp. (Link establishment can be automated using the dialer chat script where permitted by regulation.) However, the HF segments of our networks are in constant flux, due to changing propagation, and a reliable stable network there remains a challenge. Not a lot of work has been done by amateurs on dynamic routing protocols, but that's what's needed to make the HF segments of the network really viable.

No need for all that trouble. The Win95/98 version of FlexNet allows use of all of the native tcpip apps for that platform with either AX25 or tcpip packet radio networks. Lots of hams are already using FlexNet to do exactly this.

The gentleman is not talking about using existing browsers though .. He's talking about writing a new, Ham Radio specific browser. I think he has an excellent idea there, and wish him luck in his project.

I think you are missing the point here. First, VHF packet is mostly a local issue, because the loss of infrastructure nationally.

Gary Coffman wrote
>Adding FEC on VHF/UHF is often just excess overhead if the RF engineering
>is done correctly.

RF Engineering is done correctly at the radio site. The problem is, that we (the
Ham community) cannot afford to link across the state, to bring in communities. So we have wonderfully engineered radios with no systems engineering. That is: Long Range communication.

> And there is little excuse for not doing the RF engineering
> correctly, except perhaps in cases where you're contending with military radar,
> or overly long paths in a sparse topology.

If you would move the exceptions to the head of your thinking, you will be in sync with my thinking.

> I'd also note that FEC isn't necessarily
> a layer 2 issue. It can be done at the physical layer.

I agree. The hardware/software side of engineering is always hard to pin down today.

>The main problem on VHF/UHF is packet collisions. LAN engineering to avoid
>hidden terminals helps collision problems a good deal, probably more than any
>change in the link protocol could (short of going to token ring anyway). Use of
>full duplex packet repeaters significantly reduces collisions, as does proper
>coordination of LAN and trunk frequencies.

The main problem on VHF/UHF is that a loss of 1 bit results in the transmission of over 2,048 more bits. This is known as unreliable transport. This is true if
there is no other channel use, and it is noise-free. For some reason you lost a bit. Could have been the toaster coming on and spiking the line.

>When those physical layer issues are properly addressed, as they should be,
>then AX25 UI frames make an adequate MAC layer.

Given a federal grant of 1 Million per community, we shall see your vision come to pass. There no sense living in a dream world. You're talking about textbook theory. Come on, this is rather ridicules.

>They have more overhead
>than is absolutely necessary, but it is tolerable for the convenience of having
>MAC addresses map directly to call signs. Connected mode AX25 is a lost
>cause and should be avoided in most cases. Leave that as a layer 4 issue
>between the hosts where it belongs.

This was the thinking in 1989 or so. It's been completely blown away by
reality. If you wait for layer 4, you are depending on a solid piece of wire.
If you want reliable transport, it has to be in the first two layers. Otherwise
we exponentially back off all the way to hell.

>We don't have to invent new link level protocols to have satisfactory packet
>switched networks on VHF/UHF. In most cases that's just putting a bandaid
>on a cancer. The real problem is addressed by fixing the physical layer.

Show me the money. How do we design something that replaces the thing
we don't have. There is no money, so what we need is an innovation that
substitutes adequitely that thing we hope/want Santa to bring.

>If the links are poor quality, of course, then performance suffers. On HF, the
links
>are almost always poor quality due to skywave multipath, changing propagation,
>and interference. We can't fix that with RF engineering (though we can help
the
>skywave multipath problem by using diversity techniques). Use of FEC on HF is
>virtually mandatory. And intelligent link layer retry mechanisms are needed.
AX25
>performs very poorly here.

If the error rate can be synthetically improved, it will be as good as antenna
gain. A dB is a dB. Thus your argument can be applied to VHF/UHF as well.
RF engineering stops at the radio. Systems engineering starts when the radios
don't work when you hook them to an antenna and move them apart by 45 miles.

>So, with proper LAN engineering, AX25 UI frames form an adequate MAC layer
>for TCP/IP on VHF/UHF, and Clover II supplies an adequate MAC layer on HF
>when used with slip or ppp. (Link establishment can be automated using the

I hope you have your tooth under your pillow :-)

I'm a little sad that people are still shoveling this crap out for general
consumption.
You have to know they haven't been west of the Mississippi in at least 40 years.

Steve

For what band? I don't recall anything from late 70's or early 80's,
but it would have been easy to build an FM. I don know that there's a
PVC directional antenna available, I think from Ramsey, for AM band.
I've heard good things about it, but no first-hand experience.

Yep! It can be done easily under Windoze _95_ (not 3.x or 98).

If you consider using FlexNet to drive your TNC/whatever, you can use
FlexIP, a little software module that emulates a serial modem. Works
great out of the box.

The only drawback is (at least at the moment) it doesn't do ARP. You
have to manually enter all the IP number<->Callsign pairs.

That is not because it "at the moment does not do ARP", but because
it does not do IP routing. The designers only believe in their AX.25
router and don't want to build a similar router to route IP. Hence, you
use AX.25 tunnels to transport your IP traffic to your destination, or
at least to the nearest system that can really route. It's that callsign
that you have to enter, and as long as you handle this on a case-by-case
basis you have to do this for each IP address you want to contact.

Of course this sucks and it does not scale. But explain that to a Flexnet
guru...

I enjoy ham radio when it is actually getting to know other
hams on the air and being able to run into them more than
once..

I am very active on 80 and 40 meter pactor/gtor and find
this mode very condusive to a long-winded "let's share war
stories" type of operation. I am not into contesting, but if
you are, then that's your niche in ham radio. Personally,
exchanging signal strength reports and qsl information, only
to run off and do the same to the next station seems a waste
of spectrum resources...

Not to mention, that most of these are robots.

Basically the whole disease is what General Patton referred
to as "paper hangers."

That is, people who's sole lease on life is to accumulate paper
to hang on the wall. The extreme being people who belong to
Mensa type organizations. If their IQ was so high, they must
realize how stupid the whole idea sounds. But that isn't the
case.

There's four things to hang on your wall: 1) Your High School
Diploma, 2) Your College Bachelors Degree, 3) Your College
Masters Degree, and 4) Your Doctorate.

Everything else is akin to mowing the lawn...

I have a KamPlus that does *almost* everything, except Clover. Does
anyone have the source to find a Clover-ready TNC that is affordable?
I saw a couple ads before and found that those Clover-ready TNC (or
interface cards) were not cheap at all -- over $900 collectively
speaking. That's expensive for a ham on a budget like me.

Thanks in advance.

Go to the HAL Home page. (do a search on: clover hf packet or some such).

They have a $400 Clover TNC that does Pactor, AMTOR and RTTY. Unlike
the $900 model, it doesn't have power control though.

Huh?

I believe he was orginally referring to name resolution, commonly taken care of by DNS servers. It isn't ARP, and it certainly doesn't have much to do with IP routing. As far as I can tell, DNS is entirely possible via packet, just slow at 1200bps and unnecessary for small networks.

And IP routing is possible, no AX.25 doesn't do this, but it isn't AX.25's job to. IP routing should be handled quite nicely by Linux or any other software that treats the radio modem as an ethernet device and supports some form of routing.

In fact, has anybody ever tried this?:

Set up my home machine to route everything but my local network to the TNS device, with another machine with a full-time internet connection running as a gateway machine? Wallah!, full unfettered internet access to home. Better yet, use that same gatewya machine to act as a gateway routing 44.x.x.x traffic out to it's TNC, and instant seamless access to the local TCP/IP network from my desktop machine at work.

Of course you can use any MAC layer you like, below IP.
You can even use an entirely different transport instead of TCP/IP.

This does not at all preclude the use of an existing browser.

Just like that (snap fingers) :-)

Ok, Ok, I'm poking fun at you. Basically you are steering this thread back to Off the Shelf TCP/IP. What the person who started this thread wants, is to know if building a dumb terminal with a Netscape look would be worthwhile?

Have anything to contribute to that?

Best Regards,
Steve

It's a proprietary protocol (as are GTOR and PACTOR-II), so you won't find
many sources. Try HAL, they have a less expensive box now.

That's a big assumption. These things may seem routine, but they're not.
Most amateurs that I've seen don't have a service monitor, deviation meter,
or even a decent frequency counter. They attempt to set up a 9k6 radio
just like they did a 1k2 radio - which is essentially by ear. As you can guess,
it generally doesn't work all that well, and they start flailing around trying
to fix it - without really understanding what is wrong. Things like "IF passband
phase response" are just grist for a confused mill.

> In the Mastr II, the IF fillters have too much phase distortion near the passband

> response with good phase linearity, but the radio's SNR and immunity to
> nearby strong signals is reduced, of course.

This is what lots of people do, usually because they read a note on the net
somwhere where someone suggested it. They often do this before figuring
out if they need to, in my experience.

> The better solution is to replace the filter with one that has better differential
> phase response. That generally means a filter with a broader passband and
> a gentler shape factor to stay away from the phase shift inherent at the corner
> frequencies of the filter. That costs you some SNR and a bit of nearby strong
> signal rejection too, but not as nearly much as simply bypassing the filter.

Well, you *can* replace the filter. Or, you can do something easier, like
use a lower deviation, say 2.5KHz, and work with the other 9k6 operators
in your areas to do so. The reduced deviation also helps deal with relative
frequency stability. Sure, there's a bit of an SNR loss here, too, but you're
not going to have much luck at 9k6 without fairly strong signals in the first
place.

> The discriminator used in the Exec II and Mastr II is a bit odd. It is not zero
> center. You have to remove the 2.5 volt DC offset before feeding the modem.

> more modern IC design, and just keep the excellent front end and first mixer
> of the original receive strip.

Huh? The 9k6 modems I've looked at use large-value coupling capacitors
to block DC at the input, which should do the trick in most cases, and is
much better than using an op-amp (which would be a DC drift issue).

I'm not sure what would be the advantage of tossing the entire IF strip and
engineering one from scratch. If you're interested in IF strip design, I guess
that would be good experience, but if you're interested in 9k6 operation
this would be worse than a waste of time.

> will.

Sure, Micors and Maxars (Flexars, too), are pretty good. Direct-FM radios
like the Maxars and Mitreks are a piece of cake to set-up for 9k6, and have
far more than adequate receiver performance for most amateur situations (we're
splitting some pretty fine hairs here).

Actually, I think he is looking for a 'smart' terminal with a netscape look. :-)
A dumb terminal can't do any formatting... it sends text, it receives text... a
lot like RTTY with an 8 bit (7 in some cases) character set.
I think he wants it to be mouse responsive, colourful, graphical, but still
efficient over the slow packet connection-
I know this isn't the right example, but something close to RIPTerm would be in
the right ballpark, I believe.

Hi,

I want to connect 2 buildings about 3 miles apart (line of sight) with a wireless link. I've seen commercial products that can do this at > 2 Mbps but they are really expensive. I've found stuff on the net about microwave ham links about i'm not sure exactly how to go about building one. For example, parts are sold at http://www.shfmicro.com Could some one refer me to a plan on how to build this type of link (preferably cheap and easy to build). Thanks very much in advance.

I think Gary moved up to management, or is spending too much
time out the back door on smoke breaks :-)

Anyone that would use a Master II for 9600 is insane!
Hell, it's almost worthless on voice.

As for a deviation meter on 9600, it will only be relative. So is
your ear. 9600 is not 1200 and 2200 Hz tones, it's a complex
waveform, and most service monitors will not show the deviation
correctly. But in any case, a simple deviation meter I had
published in 73 way back before Wayne lost his marbles, is on
my ftp server:

ftp://www.usa-site.net/hamradio/devmeter.gif

The PC board is available from FAR Circuits.

Setting deviation isn't rocket science, and I am not certain what you really intend with "So is your ear.". Your ear is an awful tool for setting 9600 baud deviation. Not only is the ear poor at detecting absolute levels (which is what we're really talking about here), the response of different radio audio chains to 9600 baud pseudo-noise is far too variable.

The best tool for setting 9600 baud deviation I've seen is an oscilloscope, and a reasonably calibrated discriminator. An easy technique that generally works is to DC couple the o-scope to a 'flat' discriminator out (**not** de-emphasized audio out), and use another radio to generate a signal on-frequency, +5KHz and -5KHz. Observe the discriminator output voltage at each frequency. In most cases, the 5KHz offset will generate essentially the same offset voltages from 'center' (on-frequency). If you've got the ability to generate a signal with steps smaller than 5KHz, you can try to evaluate the discriminator linearity.

Key up the 9600-baud transmitter with data. You'll see a pseudo-noise signal on the o-scope at the discriminator output. Adjust the transmitter deviation for a peak reading about half the width of the +/- 5KHz readings. Sure, this is a relative reading, but it is relative to something essentially absolute.

If you *really* think you can use your ear to set 9600-baud deviation, try turning the deviation all the way down and see how close you can re-set it without the scope.

By the way, 9600-baud isn't that complex a waveform. It is essentially a binary FSK signal with band-limited transitions from one level to the other. It has pseudo-noise characteristics, but isn't particularly complex. A 1200-baud AFSK signal is probably more complex.

> But in any case, a simple deviation meter I had
> published in 73 way back before Wayne lost his marbles, is on
> my ftp server:
>
> ftp://www.usa-site.net/hamradio/devmeter.gif

Cute little circuit, except the input coupling capacitor (10nF) is
really too small for use with 9600 baud and the circuit really
seems to depend on the integrating behavior of the mechanical
meter movement. OK for voice or AFSK, but in any case, I
wouldn't try using this for 9600 baud.

>

It seems to me that working 100 countries is actually fairly easy given just a modest station and average sunspots. Getting the cards seems to be the devil, and then there's the nuisance of getting them to a checker if you don't happen to live in the USA.(actually, there was an accredited card-checker operating at the RSGB HF convention last weekend, which saved a number of people having to trust sometimes irreplacable records to the post)

DXCC certificates impress me, but chiefly as evidence of the perseverence of the operator and his or her skill in navigating pile-ups. The people with scores approaching the total number of countries that have ever existed have devoted most of their lifetimes to their pursuit, which has to be impressive. I find a station that can run moonbounce SSB just as impressive, I find a homebrew transceiver - especially if it isn't directly built to a published design equally impressive, too. The good thing about this hobby is that people can exert themselves in different ways.

> I wouldn't have had many, if any, meaningful conversations if I had
> spent a half hour per contact, instead of 20 seconds. And the end

I'd never thought of that in those terms. That's a startlingly good way of putting it.

Cheers
David GM4ZNX

4255. Re: Ramsey kits and packet and 9k6?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-13 00:00:00 UTC
From: Steve Sampson <ssampson@usa-site.net>
Message-ID: <01bdf69d$c708c120$85228cd1@cadillac>
Source record: 22097
Cross-posted to: alt.ham-radio.packet,rec.radio.amateur.digital.misc,uk.radio.amateur

When I first got on packet I used the same technique. I had an
old O'Scope that I would monitor the deviation of various packet
stations on the air. I was pretty shocked at what I saw (no one
sets their deviation) :-)

I did find one station that was not only right on the money, it had
a distinction of being the same deviation for both tones. It was
the only station I ever saw with this. Turns out it was maintained
by the owner of a pager company. He called this "twist" when the
tones were different, and had an input circuit to his audio that
fixed it.

An old ham buddy and I had a competition to see who could build
the cheapest deviation meter, and he won. His could be built for
$5, and mine took a whole $20 bill :-) This was easier to take to
a remote site than an O'Scope though.

When I got on 9600 I went back to the O'Scope method, and like
you, played around with the discriminator (or it's poor cousin, the
ratio detector). I used the DC mode to align my radio's LO (it's a
Tekk) to center on the distant transmitter. As luck would have it,
he was on the right edge of 5ppm, and I must have been on the left.

Anyway, to make a long story short, hooray on the O'Scope, do it,
live it, love it :-)

[I wrote Steve privately in response, this is an abbreviated version]

I had the same experience. It is amazing that 1200-baud works at
all when you see the majority of signals. The biggest problem are
people running into hard deviation limiting.

[...]

> Anyway, to make a long story short, hooray on the O'Scope, do it,

It all boils down to understand how things are supposed to work,
and making clever use of tools at hand to make sure they work like
they supposed to. That's supposedly a unique advantage of radio
amateurs.

Larry:
I built 2 of them during the last two years and I am VERY satisfied with this unit.
- Easy to build
- works at least as good as ready built units

I used them for Satellite work (Oscars 10 and 13) i.e. mostly in the denoiser mode and a friend of mine used it for EME work (in very narrow CW) with excellent results.

You should buy the metal enclosure along with the electronics package. Use a shielded power supply with a shielded cable because the power input line is sensitive to RF.

Hope this helps

Hello,

I have two Analog Devices Inc. signal processing labs for sale or trade. One is still in the box, the other has been used about 20 hours for testing algorithms. These are based on the ADSP-21020 Floating Point processor. The PC Boards are about 6" x 12" mounted on a piece of 1/4" plexiglass and include processors, memory, A/D and D/A converters, amplifiers (software programmable) and serial port as well as expansion ports for additional memory. They can sample at up to 48 Khz. (stereo) with 16 bit resolution. They include full documentation and a "C" compiler with documentation. They do require an external power supply. The original cost was about $2500.00.

I am asking $500 or best offer for both labs and documentation, or will trade for ham gear such as vhf/uhf transverter, hf amp, etc.

tnx es 73

I hope I don't start up the old argument about 'evil' contests. But on contest weekends, I find WWV more interesting to listen to than the rapid "traffic" of contesters. I've only been in the hobby 2 years, but I wonder whether there were always this many *&^%$ contests, and also wonder, if the frequency of contests has changed appreciably over the years, what has caused that? Is it a hardware issue?

Steve> No, he said ARP. That has nothing to do with DNS.

Yes, I said ARP and I meant ARP. Flexnet (more specifically FlexIP)
has troubles with AX.25 ARP frames (it chokes on them), and more
importantly, it doesn't generate any ARP requests.

By the way, IP routing has nothing to do with Flexnet or Flexnet
routing. IP routing must be done at the IP layer, and should be done
by W95 native TCP/IP stack. If W95 can't/doesn't do routing, that's
another story.

Flexnet (via FlexIP) is only used here as a level 2 layer (just like a
NIC or a modem). And I think they don't do routing either and nobody
really cares ;-)

>> In fact, has anybody ever tried this?:
>>

Steve> Yes. It's called JNOS on DOS/Windows/Linux.

Or Linux Kernel native AX.25 + Linux TCP/IP stack.

Cheers. Iñaki.

Trying to be as diplomatic as I can be - if you don't know what you're doing, *especially* if you want to use this for business purposes, buy the commercial gear and have it professionally installed. You will save yourself time, trouble, money and hair in the long run. You may even have legal relief if somebody blocks the path with a building later. If that is just too much, consider leasing a line between the buildings from the phone company. You might also want to consider talking to a networking/communications consultant in your area to see if you have other options.

A friend of mine has put together a system using standard "wireless
office" ethernet cards coupled with high-efficiency directional
antennas to obtain 1Mbps at a range of about 3-4 miles. The card and
antenna cost about $1000 for each end and of course you'll need to set
up a router/gateway on each end as well. An old 486 running FreeBSD
or Linux can take care of this just fine and won't cost anything other
than your time if you have the hardware laying arround.

>

Use XML. It's well suited for writing a packet HTML-like
"metalanguage", and it's standard. You'll probably need to also
implement its associated style language, XSL, which can map XML tags
(The XML markup <MYCALL>N1KGH<MYCALL/> could map to
<CITE>N1KGH</CITE>) to HTML for presentation in existing browsers.
But it can do much, much more, such as mapping XML tags into command
strings for rig control.

Implementations are available and XML itself is almost a no-brainer if
you are already computer literate. What's more, work is underway to
implement XML frontends into some popular DB software.

Deciding on this "ham markup language" is the real trick, though, and
will largely depend on what it's ultimately used for. DX-clusters?

We are less than 30 days away from the Odessa Texas 15th Annual Hamfest!

If you haven't been here, don't miss this year! Lots of prizes, hidden transmitter hunts, lots of door prizes, lots of fun. We fill 21,600sq ft of space with over 200 tables of vendors & hams. Yes, we are not the largest fest around.... But, we like to think it's a fun and great fest. Ask any of the dealers that have been attending for years.
Texas Bugcatcher
The Ham Store (KCOMM)
WB0W
Rad-Com Radio
and many more...

This year is the first year we have had online & secure registration. No, you do not need to attend to be eligible for the major prize drawings on Sunday. And, any unclaimed registrations are put into the hopper prior to the major drawings on Sunday. Hey! Come check out the Sunday Lunch/BBQ!
Prizes include:
Alinco DX-70T
ICOM 2710
ICOM T7A
ICOM T2A
ICOM T2A (yes, two of them)
ALINCO C1T (2 of them)
ALINCO C4T (2 of them)
COMET GP-6
And...possibly a full computer w/monitor...still working on this prize.

Check out our webpage at: http://nonprofit.apex2000.net/hamfest/

In article <6vu5b5lpf1@nnrp1.dejanews.com>, nick_hall@usa.net wrote: To answer Carl's question, this isn't for business purposes, it would just be a handy and *cool* thing to build. It's not something I can justify spending > $1000 on right now. After doing some searching I was able to find an article by N6GN about this type of thing at http://www.tapr.org/~n6gn/hr89/uwvarticle.html The problem is the article seems to have some stuff missing. No schematics; I can't see how it could be used to build the link they are talking about. It would also be nice if it could interface to a standard ethernet card instead of one of these rare PCLANA cards but I suppose something could be hacked. Does anyone know of some more stuff along the line of this article with schematics? How about using some partially pre-built components like at http://www.shfmicro.com/gunn.htm I would think this would be a really cool project that a lot of people would be interested in but I can't seem to find in-depth plans. Thanks.

4280. Which radio for 9600 bps?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1998-10-14 00:00:00 UTC
From: Marco Menchise <marco.menchise@studenti.ing.unipi.it>
Message-ID: <3624BE25.F0752E82@studenti.ing.unipi.it>
Source record: 22122

Hello,
I would like to start playing with 9600 bps packet using my soundcard as a modem. I have a PC running RH5.0 Linux and a SB Vibra PNP soundcard. Last week I compiled ax25-utils and and checked soundmodem driver using smdiag utility and my ears. Everything seems to work fine.

Now I should get a radio. I asked my friends about but they said that most radios don't work well with 9600 bps packet, even those "9600 bps-ready". Many problems came from the transmitter PLL and from the receiver low frequency filters. The best solution for making packet seems to be a dedicated one-frequency radio, like a TEKK or MAXON module, which have a crystal oscillator transmitter and wide-band filters in the receiver, but those are too expensive and have very low flexibility.

So, i am going to get a commercial two-band FM voice-capable rig. I read on a PacComm catalog that some old two-band radios, which don't have a 9.6 kb port, can be easily modified to get them working. They suggest to connect input directly to the varactor in the main VCO circuit of the transmitter and to obtain output from pin 9 of the receiver chip.

Now, I would like to know if such a rig might be a good solution and what perfomance could I get from it. I also wish to know about problems concerning soundcard and radio connection (impedance matching, level adjusting etc.) and what commercial radio could be more suitable for such a job.

thanks in advance,
Marco - iz8aeb

Well, to use it as a phone you need to find a repeater in your area. Then find out who ownes the repeater and contact them. You need to get an access code to "bring up" the autopatch. the owner of the repeater will be able to give you more help on this. Most times you need to join the radio club in order to use the autopatch.
73 and Good luck

This sounds interesting.... I just had another think.
What if the original pages were written in HTML/XML and then were fed through an intelligent compiler?
It would filter out everything unnecessary, ie, the 20 or 30 commands seen
in frontpage. (You know what I'm talking about. Yech!)
Next it would compress everything into it's own binary 'packet,' ready to be sent over the air... plus, commands like quickly
become \T /T or something like it. Even compressed, the first one would take up much more extra space.

Last time I checked, that PK-88, or that KPC-2 didn't compress... we're talking packet here, not v.90 56K- sorry. Even with compression on higher speed packet, the more redundant data that can be chucked out to /dev/null, the better... this will probably make in fairly intensive on the server side, and the receiver side, but anything 386 or higher should be able to do this just fine.

I don't think the idea is to put one of these on the TCP/IP network... although it can (and will) be done eventually, we need to get those local packet BBSs out of the stone age. If they took the same amount of time to load, which would you like better?:

```

```

Hell, I love my commodore 64. I use it all the time. I have a 128, an A=500, and an A=2000... let's face it... these are outmoded. I use them just the same, because I love 'em to death. The thing is, though, that these machines as is without any expansions, as many amateurs and hobbyist and collectors use them, just don't pack the wollop that they used to...

I think the idea of this project was to get hams who have those 1200 baud TNCs back out of the clost, and start operating again, but on their 486s and Pentiums... and loving it all the same.

Currently, I access the packet BBS locally via telephone, because I don't have a TNC at the moment. You know it, and I know it: The user interfaces for most BBSs currently in operation really, really stink. This is coming from a unix guy. ;) 1200 Baud isn't that bad, if it is snazzy looking. 1200 baud in

combination with plain text is boring, and a good many people won't look back. We need something out there that will make people use the equipment already in their possession- packet shouldn't be something only for rich people with oodles of money for 56k packet modems and UHF radios.

>

Yes, but again, I want to Power up my radio, I want to plug in my TAPR-2, I want to stuff in a CD-ROM, and off I go. We need something that will take efficient usage out of the the low speed devices you have in your closet! I don't want replacement roms- I don't need them. I want to use what I've got already- I don't have the extra money for anything else.

>
> You don't have to pick short, cryptic names just in order to get good
> transmission performance, nor do you have to reinvent the wheel. And
Well, I've got to admit, those were hasty (and nasty). I would pick better ones, but a simple scheme which is consistent is best. ! activates a code, # disables it, or some such nonsense... the same code could be used in each circumstance, just using a different off code. Instead of HTML you could use \B /B... HTML is nice and easy, I know, but even with compression, it doesn't afford us the efficiency we require at 1200 baud.

> if FrontPage puts in too much garbage, simply don't use it; after all,
> if you do your own ad-hoc system, you won't even have a choice.
That's what I was saying... if we use HTML as a common protocol (it is a standard, after all :) and discourage people from using editors, there are those who will... and it [packet network, packet simplex frequencies] will be clogged up just like a good portion of the internet.

One major point about adhoc- no HTML editors! Good, we agree (I think) on something.

>
> If you want something that's more compact than HTML (and maybe can

> vector graphics.
I've heard of a couple of these... in this case, even dumb terminals, or older terms/computers could take advantage of them. Any hope in making up a revision 2 to include relative mouse position? (or clickdown)

These could work... I was thinking of ripterm modified enough that we could call it something else and it would be optimised for 1200 baud... I used to use it that slow of a telephone line... every now and then when the sysop changed the raster icon/background it would give me a pain in the neck because of the long

(5-10 min) wait while downloading. If we have some generic ones included with software, maybe generic sounds too, then the sysop could add any other icons (s)he wanted to spread out over the first 2-3 logins, by maintaining a complete user database, while maximizing available bandwidth. I live in Ottawa, not a terribly active 2-metre digital area- however, in Very large cities such as Toronto or New York, I'm sure that the bands are full to capacity (right, RIGHT? :-) and eed to time share efficiently... It's like sharing 10 phone lines with 1000 people- it doesn't work unless you can tolerate each other... and you can't tolerate each other until you get AT LEAST 50% of the computer time. :)

> The last thing the world needs, IMO, is yet another ad-hoc
> graphics/hypertext protocol. Pick one of the ones that is
> already out there, preferably with existing implementations.
You're right- this is a good idea, and maybe there's one out there that is almost exactly what the ham community needs.
Anybody have any good ideas?

Hi, Oxygen. I'm a 15 year old ham as well, but I'm already into the swing of things... you'll be able to get used to it quickly, don't worry. People may ignore you the first couple of times, but you will find someone out there who will help you out... if you go on a repeater, and you hear someone talking about something you know about, and think you can help, you can jump in with your sign after the beep. For example:

VE3ABC: I've been having some trouble with my computer- windows hangs when it just before it shuts down. I have absolutely no clue why! *BEEP*
VA3CBA: Hmm... that is strange. *BEEP*
(ME) VA3CSG: VA3CSG. *BEEP*
VA3CBA: Go ahead, va.. uh.. va... uh... back to you. *BEEP*
VA3CSG: That's Victor Alpha Three Charlie Sierra Golf. My name is Colin... I'm new around here, but I might be able to help. My computer used to do that too, until I installed, etc. etc... *BEEP*

And that was probably my first contact! Don't let it worry you. If you mess up call signs, most hams are very forgiving... they were new once too.

Once you have "mastered" 2 meters, consider learning morse code. I thought of it as a chore once, too, but I'm learning how to use it. True, it may be (a little) outdated, but it can be FUN if you like that kind of thing! (I do, anyway.) You'll have access to the HF bands, and talk around the world! It's great fun, you'll really enjoy yourself if you take your time and ease into things.

Ask about amateur radio meetings in your area... once you're there, find the people you talked to on the air. They'll introduce you to some people who you'd like to meet: Like, for example, other young hams. At a meeting of 20 members to 500 members, there will usually be 2 or 3 other hams your age there as well... usually new.

Don't be afraid to use your name on the air or in newsgroups... you don't need to give a last name, however, having a 'first' one gives you a little more 'authenticity.' Often hams distrust anyone who doesn't use a first name, with good reason, as those who won't usually are thrown into the same bin as 'phreakers' and 'cbers,' even if you are a responsible and fully licensed ham. If Oxygen happens to be your real name, become something like 'Charlie'. ;)

Your question was: how to use youe H-T as a phone:
This is a function called 'autopatch' and differs greatly from repeater to repeater. Most repeaters: You key up the repeater, and enter command mode by pressing two digits. Next, enter three more which is the password of the patch. Then, you get a dial tone, and there you go... to hangup, dial the 2 number access code.

Repeater users will NEVER (almost never. :-) give this info out over the air because they like to keep track of who is using their phone lines... write down the owner of the repeater's call sign, and go looking for him/her at the next meeting. It'll take a little while until they get to know you, however, so you'll need to wait. If it's an emergency, just ask someone to bring up 9-1-1 EMS for you... they will if you can descibe the situation, eg, 25 car pileup, blood everywhere. If you sound like a panicky 15 year old, they won't give it to you. Be mature and be wise!

Anything else, email me. I'm here for you!

>I think you are missing the point here. First, VHF packet is mostly a local
>issue, because the loss of infrastructure nationally.

Unless there are satellite relays, VHF/UHF packet networks are always local
to semi-regional in scope. That's because latency kills a network with too many
relay hops. If it takes more than about 8 hops to traverse the network, then you'd
better consider subnetting into a number of smaller networks. Those can be
internetted together with a backbone which requires fewer hops.

>Gary Coffman wrote
>>Adding FEC on VHF/UHF is often just excess overhead if the RF engineering

RF engineering includes link budgets and path profiling. We may not have the
four nines of the old AT&T Longlines relay network, but there's little excuse for
engineering links with poor fade margins and consistently high loss rates.

>> And there is little excuse for not doing the RF engineering

Then I'd suggest working on solving the RF problem rather than attempting to
bandaid it with additional protocol overhead. That costs you on every packet.
Most RF link problems can be solved, and the benefit of solving them is better
overall network performance.

>>The main problem on VHF/UHF is packet collisions. LAN engineering to avoid

>The main problem on VHF/UHF is that a loss of 1 bit results in the transmission
>of over 2,048 more bits. This is known as unreliable transport. This is true
>if there is no other channel use, and it is noise-free. For some reason you lost
>a bit. Could have been the toaster coming on and spiking the line.

I ran AX25mon for several months watching our old simplex LAN. The primary problem was collisions, not noise spikes. Going to a full duplex repeater virtually eliminated that problem, and network performance jumped far in excess of just 2x. If you're getting noise spikes from your toaster, you might want to suppress that, or elevate your antenna to get it out of the toaster's near field.

>>When those physical layer issues are properly addressed, as they should be,
>>then AX25 UI frames make an adequate MAC layer.
